

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at http://books.google.com/

PREFACE.

THE requirements of a general practice carried on in the metropolis for upwards of twenty years, together with the experience of numerous medical friends, both in town and country, having shown the necessity for, and the utility of, a work such as the present, as an aid to the medical practitioner. the compiler was induced to devote his leisure hours for several years, while engaged in extending his knowledge of medical literature from books and journals, to extract such prescriptions as in his judgment and in that of others on whose opinions he could rely, would, when collected together and properly arranged, constitute a work of considerable professional value,—such as would be of service, he trusts, to all engaged in active practice. Most of the prescriptions are authenticated by the author's name being attached, but this could not be done in all instances. They are arranged and classed according to their physiological and pathological action on the human frame, -a plan it was considered advisable to adopt, as it would render the various prescriptions more ready of access, and consequently the work itself more useful to the medical practitioner.

The commencement of this work comprises a brief sketch of the symptoms and treatment of certain accidents to which the human frame is liable, and also of the management of cases in which poison has been accidentally or purposely administered. In preparing this part, some of our best works have been consulted, although, to save space, references are omitted. A notice of Artificial Mineral Waters, from the Codex Gallieus, follows; next, an Abstract of the Three British Pharmacopæias, and an Abstract of Magendie's Formulary; and the work concludes with an explanation of the medical abbreviations used in prescriptions.

ACCIDENTS, ETC.

ASPHYXIA.

ASPHYXIA, a term which was originally applied to indicate a suppression or stoppage of the pulse—a suspension of the circulation—is now employed in a larger sense, and signifies suspension of all the vital phenomena by causes which operate exclusively, or at least specially, upon the respiratory organs. Asphyxia may be referred to three principal sources,—exclusion of air from the lungs, as in strangulation, drowning, &c., introduction of air into those organs unfit for respiration, and of air possessing deleterious qualities. Each of these species presents several varieties, with phenomena modified by the peculiar causes from which they have resulted.*

ASPHYXIA FROM DROWNING

Is generally induced in a few seconds or, at the most, a minute and a half, after complete submersion of the body under water; when it has continued for the space of ten or more minutes, it usually renders recovery hopeless, though, in rare, almost apocryphal instances, persons have recovered after being immersed more than twice that period. It is said, indeed, that a person who had been under water for an hour, was nevertheless restored to life by the Amsterdam

^{*} Palmer's "Dictionary of Medical Terms."

society. This statement may serve to encourage, in even the worst cases; nevertheless, it seems more probable that the period of submersion in Dr. Douglas' case—fourteen minutes—is the longest, where there is real ground for expecting recovery; and in that, the efforts at restoration were per-

sisted in for eight hours, ere they were effectual.

The body of a person who has been under water for a few minutes, will be cold, insensible, pulseless, and without The eyes, and perhaps the mouth also, will be movement. closed, or the latter may be open and foaming, the face livid and puffed, and the limbs relaxed. It should be carefully removed, laid on the right side on a plank, with the head rather raised, and well supported by an assistant, to prevent its rolling, to the nearest house, or to a warm and dry situation. If it be carried far, it should be stripped, first rubbed dry, the mouth and nostrils cleansed from mucus, froth, &c., and then covered with the spare clothes of the bystanders, to prevent evaporation, and the cold which this would occasion. The principal objects to be pursued, are to rouse the circulation and respiration, and to restore animal heat. To effect the latter object, it should be placed between warm blankets, and the temperature kept up by the application of dry heat in every possible way. hot bath, however, is very useful, and is always employed by the officers of the Royal Humane Society, in these cases. Artificial respiration used to be accomplished by pressing the tongue downwards and forwards, next passing a small curved tube into the larynx, and attaching a pair of bellows to it; or, an assistant blew into the tube to distend the lungs, which were then emptied by pressure on the chest or belly. But the use of the bellows has been objected to, because, if used at all violently, the air-cells of the lungs may be injured, or even ruptured, and the breath of the assistant injected through the tube would be contaminated by the impurities eliminated during his own respiration. Strong pressure should be applied over the chest, while the diaphragm is pushed upwards, so as to imitate the act of expiration: the removal of the pressure thus exerted, aided by the elasticity of the ribs, will induce the act of inspiration to follow, and thus artificial respiration can be efficiently accomplished. This operation, which can be practised at any time, and by any one, should be repeated as often as possible, and kept up all the time the efforts at restoration are continued.

While this process is in course of being carried out

frictions with hot flannels should be practised without intermission, and volatile stimulating vapours carefully applied to the nose. Turpentine and other powerful embrocations may also be rubbed over the chest and spine. tions are of the utmost importance, and should be persisted in unremittedly for hours, -in fact, until all hope be In the case recorded by Dr. Douglas, after fourteen minutes' submersion, as already stated, upwards of eight hours passed away, ere the sufferer shewed any sign of life. As the rubbing must be continued for so long a time, it will be necessary to have persons ready to take the place of the rubbers as they become fatigued, but they should not be in the room where the body is until they are wanted; those only who are absolutely needed should be there, as the fewer persons present, the purer the air, and consequently the better for the patient.

Even after the respiration, circulation, and animal heat have been restored, the person is not always out of danger. Symptoms may set in indicative of venous congestion of the brain, or of congestion or apoplexy of the lungs; a very dangerous complication in either case. In the former, a small quantity of blood may be taken, by cupping, from the nape of the neck: in the latter, bleeding to a small amount, or the application of leeches, may perhaps relieve the over-gorged vessels: but it is very doubtful. The abstraction of more than a very few ounces of blood would probably extinguish the already enfeebled powers of life. Fortunately, such complications as these are comparatively rare. Warm enemata. with salt and mustard, or of brandy and water, may be thrown up, and warm spiced wine got into the stomach by means of a flexible catheter and syringe—not to be attempted without such assistance till the patient can swallow. Bleeding is a doubtful remedy, but has been occasionally had recourse to when the countenance is dark, and the limbs warm and flexible.

Tobacco, in any form, is very injurious, from its depressing action. Electricity and galvanism have been found serviceable and valuable adjuncts. Mr. Shaw says he has used electro-galvanism in two cases with complete success.

The first signs of returning animation are, sighing, gasping, convulsive twitchings of the limbs, and slight pulsation of the heart. When these symptoms make their appearance, our efforts, instead of being remitted, should be redoubled, since all the danger is not yet past. The frictions and arti-

ficial respiration being continued, the pulse will next be felt beating feebly in the larger vessels, and then afterwards at the wrists. Next follows a slow effort at respiration, gradually increasing in quickness, and the action of the heart becomes more distinct. These favourable appearances ought, therefore, to be encouraged, by giving occasionally, as the person will now be capable of swallowing, some weak tea, or a little wine and water, care being taken that the spoon is pushed far enough into the mouth, so that none of the liquid may pass into the larynx. The sufferer should also be placed in a warm bed, and should be kept quiet.

ASPHYXIA FROM STRANGULATION.

The face and lips of a strangled person are black or livid, the eyeballs project, the nostrils are dilated, the mouth half open and frothy, the tongue swollen, often hanging out, and sometimes with marks of the teeth on it, and the hands are clenched and livid, as are also the nails. The dark hue of the face is owing to the circulation being impeded by the pressure of the rope round the neck: the face becoming first red, and then of a livid hue.

The cause of death in hanging or by strangulation depends generally on compression of the windpipe, preventing the access of air to the lungs, death resulting, consequently, precisely as in drowning. In some instances however, when the rope or strangling implement is applied high up on the neck, suffocation may not be complete, the cartilages of the larvnx being strong enough to resist the compressing power so far that the sufferer is enabled to breathe for a longer or shorter period, until apoplexy closes the scene. A third, but much more rare cause of death in hanging, consists in the dislocation of the spinal vertebræ. This may occur in executions conducted as in Malta of late. where the hangman, after suspending the criminal, leaps upon his shoulders, and adds violently his own weight to that of the body: but it is hardly to be looked for in cases of suicide. Death from hanging or strangulation usually is induced by a mixed cause—suffocation and apoplexy. takes place very rapidly, and resuscitation seldom happens, unless it be attempted in a few minutes after suspension has The treatment in this case, after the rope been effected. has been removed, is nearly the same as in drowning; only, that although friction is proper, there is no occasion for

heating the body, and bleeding is more frequently necessary, and should, in fact, be had recourse to in almost every case, particularly from the jugular vein. Artificial respiration should be practised, and continued for hours ere hope be utterly abandoned. The body should be stripped, and cold water dashed over it, especially on the face and chest. Electricity and galvanism have also been of great service in some cases, but should be employed guardedly when there is reason to believe that the case is complicated with apoplexy. Stimulant embrocations may be rubbed on the chest and spine. The after treatment must be conducted according to the circumstances of the case.

ASPHYXIA FROM BREATHING NOXIOUS GASES.

To the class of gases which, when breathed, prove injurious to man, belong carbonic acid gas, the fumes of burning charcoal, and carburetted and sulphuretted hydrogen.

Carbonic acid gas is the most common cause. It is met with in rooms where charcoal has been burned, or where large numbers of persons have been long assembled, and at the bottom of large vats which have stood empty for some time, of wells, and of many natural caverns. Carbonic acid gas is destitute of smell, and being heavier than atmospheric air, always falls to the bottom. It is also found abundantly diffused through the shafts and galleries of coalmines, especially after an explosion of olefant gas, when it is known by the name of choke damp, and is frequently the cause of death to those miners who have escaped the explo-Carbonic acid gas is to be met with also in the vapour of a brick-kiln, together with ammonia and hydrochloric acid. It is rarely met with in a state of purity, being mixed more or less with other gases, or diffused through the atmosphere: its injurious effects will be more or less rapidly produced, according to the innocuous or deleterious action of the diluting gas. The symptoms which it induces are, headache and a sense of great weight in the head, giddiness, and constriction of the temples, confusion of vision, ringing in the ears, difficulty of respiration, palpitations, loss of · muscular power, insensibility, and coma. In general, the face is livid, and not unfrequently convulsions are present. If the person be plethoric, apoplexy may be induced.

When a person, asphyxiated by this gas, has been got out, the body should be stripped at once, and cold water dashed over the head and chest; or if a brook or rivulet be at hand, it may be plunged into it several times, up to the neck, but not if it be quite cold. Artificial respiration should be practised, as already directed, with the double object in view of expelling the foul gas from the lungs, and aërating the blood in them by the admission of atmospheric air. Stimulant embrocations may be rubbed on the chest and limbs, and electric shocks sent through the chest and the diaphragm. When recovering, the sufferer should be placed in a warm bed, and stimulants given internally in small quantities. The plunging the body into a running stream is practised with the dogs poisoned by carbonic acid gas in the Grotto del Cane at Naples. It can only be useful by giving a sudden shock to the system: it certainly is not always practicable. Frictions of the body, and bottles of hot water to the feet, may be usefully employed.

Drains, cesspools, and privies generate sulphuretted hydrogen freely from the soil with which they are filled, and when the former have been long closed, that gas collects in large quantities, and renders opening and entering them a very dangerous occupation, inasmuch as, when it is inhaled in its pure state, it is almost immediately fatal. Nightmen, from their occupation, are most liable to be thus poisoned. The deleterious influence of this gas on the vital functions is delayed by its admixture with the atmosphere, so that it may be inhaled for a while without causing death, but respiration soon becomes hurried and difficult, nausea ensues, the skin becomes cold, the pulse irregular, headache comes on, muscular power ceases, the face and lips livid, the mouth covered with bloody mucus, and the voluntary muscles are sometimes affected with spasmodic twitchings. The gas is absorbed into the blood, which assumes a brownish-black colour.

When an accident of this kind occurs, it is necessary to remove the body into the open air as soon as possible, and artificial respiration should be at once practised. In fact, the same plan of treatment as for asphyxia by carbonic acid gas may be adopted. Chlorine and its preparations are antidotes to sulphuretted hydrogen (hydro-sulphuric acid), hydro-sulphuret of ammonia, and sulphuret of potassium; it neutralizes their action by effecting their decomposition. They should, therefore, be freely thrown into a place suspected to contain this gas before any person ventures to enter it; it would also be advisable to hold to the mouth and nose a

handkerchief or sponge soaked in a chlorine solution, so that its vapour may be inhaled, whenever it is necessary to pass into a long-closed sewer or cesspool.

In cases of asphyxia from inhaling sulphurous acid gas,—
the vapour from burning sulphur,—a few drops of ammonia
may be given internally, and ammoniacal gas inhaled with
great caution. In asphyxia thus caused, the face, lips,
hands, and nails are livid, body cold, respiration quick and
short, pulse small, quick, and feeble, pupils fixed, with
total insensibility. This gas is sometimes generated by the
combustion of coal containing much sulphur.

The olefant gas (that which is burned in the streets and houses), when mixed with atmospheric air in a proportion below the explosive power, and even when present in very small quantity, may, if long inhaled, gradually and insidiously induce asphyxia. The symptoms it causes, when thus diluted, are, vertigo, headache, nausea and vomiting, confusion of intellect, with loss of consciousness, great depression and muscular debility, partial paralysis, convulsions, and the usual indications of asphyxia, followed by death. There are many instances on record, since the general introduction of gas as a means of illuminating houses, where this subtle agent has insinuated itself through crevices in brick walls, wooden partitions, and even through the earth, and entering bed-rooms, has diffused itself through the atmosphere, and by its poisonous action has changed the sleep of the inhabitants to the sleep of death.

When asphyxia has been thus induced, and there is reason to hope for resuscitation, the body should be carried out into the open air, and treated precisely as in poisoning by carbonic acid gas. Headache and pain in the limbs have been complained of in some cases after recovery, and sometimes paralysis of the face has supervened.

ASPHYXIA FROM LIGHTNING.

In suspended animation from lightning, the surface of the body is pale, the limbs flexible, the blood uncoagulable, and the system retains its warmth long after death has taken place. In asphyxia thus caused, the body should be stripped, and cold water freely dashed over it in considerable quantities; then friction should be practised, and artificial respiration had recourse to. Stimulants of the most active kind will be found of great service. Electricity and gal-

vanism are especially useful. According to Abilgaard's experiments, animals rendered insensible by a powerful shock of electricity through the head, were immediately restored by an equally powerful one through the chest, directed from before backwards.

ASPHYXIA FROM INTENSE COLD OR HEAT.

This accident is attended with a pleasing tendency to sleep, which the unfortunate victim is incapable of resisting; but which, if indulged in, will, in all probability, terminate in the sleep of death. It is preceded by a feeling of great exhaustion and weariness, with stiffness of the muscles of the face and extremities. The aged and infirm, and those worn out by disease or habits of intoxication, are brought more readily under the influence of extreme cold than are the vigorous and the temperate. Newly born infants also soon perish, if exposed to it.

It is customary among the Canadians, when travelling, should one of their number fall into this state, to bury him in the snow, which being warmer than the surrounding atmosphere, keeps him in a state of gentle warmth till the following morning, when they return to relieve him. This example ought to be adopted by all who find themselves similarly situated, and at a distance from all assistance.

In this case, inflation of the lungs, applying volatile essences to the nose, and exciting the stomach by gentle stimulants, are proper. Our great object, however, ought to be the restoration of the body to its natural heat. If this be attempted by the sudden and immediate application of warmth, the destruction of the patient will be the certain consequence. But if it be done gradually, raising the temperature by degrees, we shall accomplish the object desired, with very trifling inconvenience.

According to this plan, we should commence with rubbing the body with iced water or snow, then with water of the usual temperature, gradually and slowly raising it till it reaches the natural heat of the body. If convenient, immersion in sea water is to be preferred, the same caution being used in raising its temperature. Stimulants may be administered internally, and by injection. The vulgar remedy, a tobacco enema, should on no account be employed; it would be decidedly injurious, and even fatal.

After the body has been thus gradually restored to its

natural heat, it is to be conveyed to bed, in a moderately warm room, and to be rubbed either with the flesh-brush, or, what is better, with the warm hand, several being engaged in this operation at the same time. In cases where only a part of the body is affected by intense cold, so as to be frost-bitten, -an event of common occurrence in Russia. Canada, &c., during the winter time, -the circulation and sensation are for a time suspended in it, and unless great care be taken, it may be altogether lost. The same plan of treatment should be employed for the recovery of a limb or of an organ, when in this state, as has been said to be necessary for the whole body. The sudden application of heat would cause a risk of mortification occurring; friction with snow, or bathing the part with cold water, the temperature being raised very gradually, as above directed, until the circulation and sensation are restored, will be of the greatest service.*

Persons are also exposed to a state of asphyxia from excessive heat. This accident frequently takes place among the Russians, who are accustomed to stay for a considerable time in the warm bath. The remedy which they employ is, cold water dashed on the face. The treatment appropriate to this variety, is the same with that recommended in cases

of asphyxia from breathing noxious gases.

ASPHYXIA OF STILL-BORN INFANTS.

The lungs should be perseveringly inflated by means of a quill or a small female catheter, which should be done by a medical man only; the heat kept up by the application of warm flannels, or immersion in warm water. Stimulants may be applied to the nose, and rubbed over the spine and pit of the stomach, and friction should be used.

CUTS AND WOUNDS.

In a simple cut or wound, all extraneous matter is to be removed; the bleeding, if it do not stop spontaneously, should be checked by bathing the part with cold water, or by the use of astringents, &c., and the edges of the cut surface brought accurately in contact, and retained by slips of

Chilblains are an illustration, on a small scale, of the bad effects caused by the sudden application of heat to a chilled part. Before they are "broken," or ulcerate, stimulant embrocations are most serviceable: the resin or turpentine cerate will prove a good dressing for the ulcerated blain.

sticking or isingless plaster, or adhesive strapping, and a bandage if necessary, or by one or more sutures, when required.

When the wound is also bruised, or torn, instead of drawing the injured parts together with adhesive plaster, it will be advisable to apply a warm bread-and-water poultice, to moderate inflammatory action and cleanse the sore. If the bruise or laceration be severe, a slough may form; if so, it will come away by suppuration, and then the ulcer will heal by granulation. When these are on a level with the surrounding integument, the poultice may be given up, and the parts lightly brought together with slips of adhesive plaster and a bandage. When a vein has been divided, the danger is very slightly increased, the bleeding in general being easily stopped by pressure. We know that a vein has been injured by the blood being of a dark crimson colour, and coming away, not in jets, but in a continued stream. All that is required is to bring the lips of the wound together, apply compresses over it, made with folded linen, and retain them there by a bandage. A higher degree of compression is requisite in those cases where the bleeding comes from an artery; if it be of a large size, it is probable that the application of a ligature to both ends of the wounded vessel will be necessary to arrest the hæmorrhage. We recognise bleeding from an artery, by the blood coming away in rapid and successive jets, and being of a bright vermilion colour.

In all cases of wounds, the first and most important object is to arrest the flow of blood, which, if from a large artery, unless checked, will speedily destroy the patient. This is to be done, not by covering the part with rags and cloths, but by thrusting the finger down to the bottom of the wound, where we shall be directed by the warm current of blood to the orifice of the artery, upon which we are to press firmly and unhesitatingly.

This being done, we may proceed to check the circulation towards the part. This is performed by the tourniquet, which is drawn tightly around the limb between the heart and the part where the artery is wounded. But as such an instrument is not always at hand, we are to be content with pressing the finger on the artery, thus commanding the flow of blood till the instrument can be procured. A silk hand-kerchief, or a garter, twisted tightly by a piece of wood, is a good substitute. Should the bleeding recur, the wounded

artery must be secured by ligature at the place where it is injured, as repeated losses of blood will blanch the patient, and exhaust his strength, causing a protracted convalescence, if it do not terminate his existence.

PUNCTURED WOUNDS.

These are generally much more serious injuries than are clean cuts, or incised wounds. The most simple example is that caused by a splinter or thorn entering the flesh. The pain is considerable, but the bleeding very slight, if any. If the foreign body cannot be, or is not extracted, it will work its way out by setting up inflammatory action, followed by suppuration. If the injury be severe, the attendant fever will be irritative, and may lead to a fatal termination, or symptoms of lock-jaw may be caused by the mischief set up in the system. This may happen, whether the thorn or splinter be removed or not.

If the foreign body cannot readily be got at, it would be better to make a free incision in the course it has taken, than to be searching for it with a pair of forceps, or other instrument, in the wound it has made. It can then be more easily extracted, and there will be the additional advantage that the punctured wound has been converted into a clean After its extraction, a soothing emollient incised cut. poultice should be applied, and the secretions attended to; the advent of feverish symptoms, the increase of local pain and swelling, and the extending of red streaks along the limb to the trunk, should be watched, as the latter indicate the extension of inflammation along the absorbents, are signs of danger, and should be met by bold treatment. Leeches should be applied freely, and the limb enveloped with warm fomentations, frequently renewed. Calomel and antimony, with purgatives, should also be administered. As soon as evidences of suppuration are present, the integuments should be incised, and the matter evacuated, instead of being allowed to burrow. A free incision is sometimes advisable. even before suppuration has commenced, to relieve the extreme tension of the integuments. A large bread and water poultice should be applied after the discharge of the matter. and the symptoms of fever treated secundem artem. They will, however, usually subside after the use of the knife, and the patient will probably get what he may not have had for several nights previously—a good night's rest. The subsequent treatment should be directed according to the symptoms. Punctured wounds with the small sword, &c., are of very rare occurrence; their symptoms and treatment must depend on the part injured: a punctured wound of the chest, presenting symptoms and requiring a treatment different from that n cessary for a similar wound of the abdomen, or of other parts. For directions respecting them, we must refer to practical treatises on surgery;—the best work for that purpose, is "Guthrie's Commentaries in Surgery," pablished by Mr. Renshaw, in 1853.

TORN OR LACERATED WOUNDS.

These are more dangerous than the clean incised wound, but less so, perhaps, than the punctured. They are attended with a large amount of inflammation and suppuration, never heal by the first intention, but by granulation. If the integuments be much bruised, or largely separated from the tlessues beneath, some degree of sloughing may be expected. After the wound has been washed gently with warm water, the parts may be brought lightly together, and retained is situ by one or more strips of plaster, according to the extent of the wound, or one or more sutures even may be required. A bread and water poultice should be applied over all, and renewed from time to time, until the slough has separated, and granulations spring up, when it may be treated like a common ulcor.

CONTUSIONS AND BRUISES.

As a consequence of contusions or bruises, we have first an impaired state of the vitality of the part, caused by the injury received by its nerves and blood-ressels; secondly, an inflammatory condition, the necessary consequence of the injury; and, lastly, a state of debility, the result of the preceding increased action. There is always more or less extravasation of blood from the rupture of the smaller vessels, called ecchymosis; a black eye gives a good example of this. This is particularly remarkable on the head, and other parts where the bones lie near the surface. If much blood be effused, and not absorbed, an imperfect suppuration ensues; when the abscess is opened, or bursts, unhealthy pus, mixed with disorganized blood, is discharged, leaving an ulcer which is difficult to heal.

To relieve the pain and local stupor attending a slight contusion, it is customary to bathe the parts with spirits, or brandy and water. When the injury is somewhat more severe, though still slight, tepid water, or any medicated lotion, containing the acetate of lead, or composed of equal parts of alcohol and the spirit of Mindererus (liquor ammonise acetatis) may be employed. In case of a black eye, the immediate application of a stimulant, such as Sp. Camph., or Sp. Rorismar, or a slice of the fresh bryony root, is recommended, care being taken that the eye itself is not touched by the local irritant. If some time has elapsed, it is better to wait patiently, than to tamper with it, and incur the risk of doing mischief.

In bruises of the finger-ends, from being caught between the door and door-post, &c., the pain is most severe for some time; it is best relieved by soaking the injured part in hot water, to which some laudanum has been added; or by wrapping a piece of rag soaked in chloroform round the finger. If the bruise be very severe, the nail will in all probability be lost, either wholly, or in part: sometimes matter forms about the root of the nail, and then its

separation takes place the more speedily.

But if the case be more severe, and if the injury occur near an important part, as in the neighbourhood of any of the joints, it becomes a desirable object to prevent the occurrence of inflammation, by the application of a dozen and a half, or two dozen, of leeches, repeating them according to circumstances, followed by warm fomentations or poultices, the limb being carefully rested the while. If there should be any considerable fever present, then bleeding from the arm, along with purgatives and a low regimen, may be necessary. The joint is generally stiff for some while afterwards: if it be the knee or ankle that has been injured, walking should not be attempted till the pain has entirely ceased; nor should it be persisted in so as to fatigue the part, otherwise chronic or low inflammation may be set up, especially in scrofulous subjects, and white swelling, with the probable subsequent loss of the limb, may be the result.

In the last stage of a bruise, where there is merely a want of tone in the parts, and swelling from the effused blood, simple friction, or with any common liniment, may be employed; such as equal parts of the tinctures of cantharides and camphor, with opium or opodeldoc. Wearing a bandage,

and pumping cold water on the part, succeeded by warm friction, have been found serviceable.

ABRASION, OR RUFFLED SKIN.

When the surface of a part has been ruffled or abraded, the first object should be to remove any sand or extraneous matter from the wound, by means of tepid water. It should then be bathed with spirits, or laudanum and water, till the pain has somewhat abated; and afterwards some dry carded cotton, or gold-beater's skin, should be applied. If the part be inflamed, warm fomentations or poultices may be used; if not, a simple water dressing will effect a cure.

BURNS AND SCALDS.

Burns and scalds differ in severity, the former generally being the more dangerous. The part injured will also influence or modify the amount of danger, as will also the extent of the injury. In scalds by boiling water, the mischief rarely involves more than the scarf skin, which is more or less extensively vesicated. In scalds by other liquids in a state of ebullition, the true skin beneath the dermis may also be damaged or destroyed. In burns, the application of the fire being usually continued for some minutes, the parts engaged become severely injured, and sloughing, to a greater or less extent, ensues; in very bad cases indeed, to such a degree, that nature is unable to rally under the shock, and the sufferer sinks even before inflammation occurs, and the separation of the slough commences.

With respect to locality: scalds and burns on the chest and trunk are exceedingly dangerous, and often prove fatal, especially to children. They are also more dangerous on the lower, than on the upper extremities. Scalding the lining membrane of the throat and glottis, in children, consequent on drinking boiling water from the mouth of a tea-kettle,

commonly destroys life by suffocation.

The treatment of these serious injuries has led to great difference of opinion, some surgeons advocating the employment of cooling, sedative applications; others recommending stimulants internally and externally, as speedily as possible after the infliction of the injury. The popular remedy of holding the scalded part to the fire, or dipping it in spirits "until the fire is drawn out," illustrates the efficacy of the latter plan. In slight cases, however, cold applications may be useful;

but in the more extensive and more severe burns and scalds. the employment of stimulants is indicated from the begin-Their use internally is clearly shown by the shock ning. and great depression which ensue. After an extensive injury of this kind, brandy and water, with a few drops of laudanum, may be safely administered every quarter or half hour, until the pulse rises in power, and the symptoms show that the shock is passing away. Meanwhile, after the removal of any portions of clothing that may remain on the injured parts, they may be covered with linen spread with Kentish liniment (linim. terebinth.), or with linen rags dipped in warm spirits of turpentine. If vesication ensue, the blisters are not to be punctured, and the greatest care should be practised in removing the clothes, not to lacerate or tear off any of the injured integuments. Flour, cotton free from lumps or knots, and carded cotton, thickly applied over the surface of the injured part, have also been found useful. Whichever of these remedies is used, it should not be removed soon; when it is changed, a similar application, or, if all be going on well, one somewhat less stimulating should be used. If the patient have strength to recover from the shock, inflammation will set in, and must be treated according to rule. When the accident has caused sloughing, suppuration after a time will commence around and under the sloughs, which will gradually separate and come away, matter being formed extensively during the process, the parts afterwards healing by granulation and cicatrization. But in these injuries, it will usually be found that even after all has apparently gone on well to the almost absolute cure, yet great difficulty will be experienced in obtaining the skinning over of the last portion of the ulcerated surface, so that it may be requisite to try a variety of local stimulants, ere the cure be completed. When the burn has been very extensive, and the patient is long under treatment, the continued drain on the system from the large purulent discharge becomes very exhausting, and the strength must be supported by nourishing food, porter, and by a dietetic stimulant, if the sufferer has been accustomed to its use. It occasionally happens, that towards the close of the case, when the discharge of pus has greatly diminished, owing to the cicatrization of a large part of the diseased surface, the patient becomes subject to a peculiar inflammation of the lungs, or of the bowels, the latter attended with diarrhea. Such a complication is usually fatal. It results, probably, from the greater action thrown on the lungs. &c., as emunetories of the system, partly from the suppression of the long-continued discharge, and partly from the newly cicatrized akin on the burnt parts — if skin it can be called, when it presents scarcely any cutaneous indications—being unable, for want of pores, &c., to assist the integuments in other parts of the body in expelling the sensible and insensible transpiration.

Another great and serious consequence of extensive and deep burns about the face, neck, chest, upper extremities and fingers, is the contraction which frequently ensues after cicatrization has taken place, the head being in some cases bent and drawn down upon the chest, or drawn to one side, the fingers united together by a sort of web, the fore-arm bent upon the arm, &c.; in short, a very sad deformity, according to the severity, extent, and situation of the burn, may follow cicatrization, which can only be partially obviated by the use of splints, bandages, &c., but which has in some cases been more or less remedied by operative interference.

Burns by means of lime usually destroy the dermis. It is useless to attempt removing the lime; its action should be neutralized by a vegetable acid—the acetic, or common vinegar, will do-it will thus be converted into an innocuous substance. The separation of the dead parts may be aided by emollient poultices, and the ulcer that remains may be treated according to the ordinary rules of surgery. A portion of lime getting between the eyelids-no uncommon accident -may prove to be an occurrence of very serious consequence. according to the quantity of lime in the eye, as it is erroneously termed, and the part which it injures. If the cornea be the part, it soon assumes a milky whiteness, which spreads and covers all the membrane, and unless relief be speedy, may destroy it, and cause irreparable blindness. If the quantity be large, although at first it be caught in the folds of the palpebral conjunctiva, an equal danger to sight may ensue. The removal of the lime thus embedded, has been recommended, and should be effected as far as is practicable, but it is a difficult task to detach it. It should also be removed from among the eyelashes. A collyrium of weak vinegar and water, is advised by some, to neutralize the lime; others recommend the frequent dropping of olive oil between the eyelids; and others, again, advise the injecting early a smart stream of water between them, in order to wash away at least the loose lime. This accident will assuredly be followed by violent inflammation, necessitating

the application of leeches, or cupping on the temples or behind the ears, according to its severity, fomentations, purgatives, &c.

SPRAINS.

The joints most exposed to this accident are the ankle and wrist; the knee and elbow being less exposed, and the hip and shoulder almost entirely exempt. It consists in an injury of the soft parts surrounding the joint, the capsular ligament which incloses it being either strained, wrenched, or torn. At first there is more or less severe pain, which gradually becomes more acute as the inflammation developes itself, and is described as excruciating on the slightest movement of the part. The joint becomes swollen and tense, and the surface hot and injected. There is also more or less symptomatic fever present. If the case be neglected, and especially if the person be of an unhealthy constitution, it will lay the foundation for one or other of those affections, vulgarly confounded under the appellation of white swelling.

In a recent sprain our first object is to prevent inflamma-This is best done by cold lotions, such as one composed of one part of spirit of wine, one of laudanum, and three of cold water. The part also may be supported with a moderately tight bandage, and perfect rest to the limb in the horizontal position, should be enforced. But if inflammation occur, as is most probable, then the bandage should be removed, and tepid or warm fomentations used. Leeches should be applied freely, and repeatedly, until the inflammatory action has been got under. In some cases even venesection may be needed; saline refrigerants and aperients will aid in lowering the symptomatic fever. When, by such measures, the activity of the inflammation has been checked, and the pain becomes less acute and more obtuse, a blister will in general perfect the cure. The stiffness which sometimes remains is to be removed by frictions, &c., but the patient should be very careful about using the joint; if the ankle or knee be the sprained articulation, walking should not be attempted while there remains any pain or suffering. When first practised, it should be for a very short distance, slowly, and without causing fatigue. The aid of a crutch will be necessary for some time afterwards. A sprain is a very serious accident, is very slow of cure, there generally remaining a low degree of inflammation about the joint for some time, which is easily lighted up to mischief by any great exertion or violence to the part.

FRACTURES.

The general symptoms of a fracture are, loss of motion and distortion of the injured limb; the broken ends of the bone admitting of being moved on each other, producing a grating sound or crepitation; and lastly, inflammation and tension at the site of the injury. All these symptoms, however, are not constantly present.

When a person has met with this accident, the greatest care should be taken to remove him in the gentlest manner, attending especially to the injured limb, and not allowing it to hang down. In fractures of the leg or thigh, the sufferer should be removed home or to a hospital on a shutter, or on a door taken off its hinges. An useful conveyance for persons severely injured is generally kept at the police stations, in London. The broken limb should be placed on a pillow, near its fellow, to which it may be secured by handkerchiefs, to prevent motion. The shutter or hurdle should be conveyed by hand, as carriage or cart conveyance will, on a rough road, jolt the injured limb, and cause great pain.

In procuring union between the fractured extremities of a bone, perfect rest is absolutely necessary; this alone, in a healthy subject, being sufficient to ensure a cure. But were nothing more done, the fracture would unite in the situation in which the bone may be displaced, and the person would have a shortened and distorted limb. In managing a fracture, therefore, next to perfect rest, we should attempt to restore the natural form and length of the limb. This is done by extension, counter-extension, and coaptation. To preserve a fracture, when reduced, in a proper situation, bandages and splints are to be employed.

Fractures in young persons are consolidated from the twenty-eighth to the thirtieth day: in adults, from the thirtieth to the thirty-fifth; and in the aged, from the thirty-fifth to the fortieth, it being understood that a fracture of the upper extremity heals sooner than a fractured thigh or log-bone.

DISLOCATIONS.

A dislocation consists in the dislodgment of the head of a bone from the cavity in which it is naturally placed. The consequences are, a change in the form of the joint, a lengthening or shortening of the limb, sometimes an alteration in its direction, and an incapability of motion. In detecting the accident, great assistance may be derived from comparing the limb with the joint of the opposite side.

Luxations are easily reduced at the time when the accident happens. But the difficulty increases in a direct ratio with the time that has elapsed from the receipt of the injury, so that, at last, it becomes altogether impossible. The reduction is accomplished by extension and counter-extension. The extending force is to be gradually increased, and is to be applied at first in the direction in which the bone may be displaced; but by degrees it is to be brought to a line parallel with the axis of the socket. At the same time some one should endeavour to raise the head of the bone over the edge of the cavity, in ball and socket dislocations.

FOREIGN SUBSTANCES ON THE EYE.

When a foreign substance lodges on the surface of the eye. such as sand, small pieces of stone or iron, small insects, &c., its presence causes pain and acute inflammation, and a copious discharge of tears, by which it is frequently washed out. The substance may either lie disengaged on the surface, or, having penetrated the external tunic, may there remain fixed. If the foreign body lie in the folds of the conjunctiva of the eyelids, the lid should be wetted, and the foreign body removed with the aid of the handkerchief, or of a probe, or by means of a camel-hair pencil dipped in oil, or what is better, a piece of paper rolled into the size of a quill, and softened in the mouth. When the substance is imbedded in the coats of the eye, as hard bodies frequently are in the cornea, especially if they be driven with violence. then a surgical operation may be necessary for its removal. This accident is of frequent occurrence among smiths, &c., and is known among them by the name of "a fire in the eye." some one of the craft being usually celebrated for removing it, employing for that purpose his nail or tongue, or the first rude instrument that may come within his reach. the foreign body be not soon removed, it excites inflammation and ulceration, and will eventually cause a cicatrix or leucoma in the membrane, so far impairing vision. A certain degree of dexterity and skill is requisite to effect the removal of a foreign body imbedded in the cornea. When it is effected carelessly or without sufficient skill, the cornea, has been scratched and injured by the instrument used. Mr. Since recommends the use of a magnet in cases of "a fire in the eye," or where small pieces of iron are imbedded in the cornea.

FOREIGN SUBSTANCES IN THE RAR.

The passage of the external ear is about an inch in length, being bounded internally by the membrane of the tympanum.

Children, when playing, occasionally pass foreign bodies, such as peas, cherry-stones, beads, bits of slate pencil, into this passage, as sometimes into the nostrils. If the substance thus inserted be of a hard, unvielding, unchangeable nature. it may remain for a long time without causing mischief, but if it he of vegetable origin, or at all apt to swell from the effects of moisture, it should be extracted as speedily as possible. This is to be effected by means of a small pair of forceps, but it should be done with great care and gentleness, and it is better to desist for a time, when attempts at extraction have failed, rather than to continue and cause violent and dangerous inflammation. Protracted attempts at extraction, especially with a struggling child, may cause rupture or ulceration of the membrane of the tympanum, and loss of the small bones of the ear. Syringing the ear will frequently assist the removal of the foreign body. Insects sometimes pass into the passage, and may deposit their ova in it. We sometimes succeed in removing them. by introducing into the ear a piece of lint dipped in honey. Camphorated oil may also be tried; but if neither succeed, then we must employ the forceps, or syringe the ear freely. The discharge from the ear caused by the continued presence of a foreign body, will cease on its removal, if cleanliness be practised, unless structural disease have occurred.*

FOREIGN SUBSTANCES IN THE ŒSOPHAGUS AND TRACHEA.

When the substance is a small spicula or splinter of bone, a fish-bone, or a pin, it may readily be removed by vomiting, excited by tickling the back part of the throat or fauces. Another expedient is, to introduce a large goose or swan quill down the throat, and then twirl it round. By this means the substance will be disengaged from the

* Vide Mr. Harvey's excellent little work, "The Ear in Health and Disease." Renshaw, 156, Strand, 1854.

folds of the lining membrane, and will fall down into the stomach; it sometimes is merely engaged in the folds of the gullet, and may be carried down by a plentiful draught of water. Even after the substance has been removed, a roughness, from the scratching or pinching of the foreign body, remains for a few hours, and causes the patient to think that it is still there. In the same way, after the removal of a piece of grit or sand from the conjunctiva, there is still a sensation as if the foreign body had not been extracted.

When it is a large substance the case is somewhat different. It may not only obstruct the passage, but also, by pressing on the windpipe, produce the most urgent symptoms of suffocation. In some instances of sudden death, the examination of the body after the decease has shown that the sufferer had perished from suffocation, caused by the stoppage of a large piece of meat which he had attempted to bolt, but which had been arrested in the gullet. and caused death. In such a case, our first endeavour ought to be to attempt to extract the substance by the mouth, if it be within reach; but if not, we are to employ the probang, an instrument composed of a piece of whalebone, so thin as to be pliable, and vet to have some firmness. with a piece of sponge attached to the end of it. This is to be carefully introduced over the aperture of the windpipe to the back part of the mouth, and then pressed downwards. In some cases it is even necessary to cut open the gullet (asophagotomy), and in that manner to extract the substance: it may be done with comparatively little danger, even by those who are not very skilful anatomists or operators. The swallowing coins, buttons, &c. - a foolish trick among children and bragging boys, -is not usually attended with danger, as the substance will frequently pass per anum, after a longer or a shorter time, whether its passage be or be not aided by aperients. It has sometimes happened that foreign bodies that have thus passed into or through the alimentary canal, such as knives, forks, &c., have been ultimately found more or less corroded.

Children occasionally suffer severely from swallowing boiling water. This accident is very frequently fatal when it occurs, from the intense inflammation it excites around the buccal orifice of the windpipe, and from the effusion of serum it causes into the surrounding cellular tissue, inducing suffocation. The most active antiphlogistic treatment in

requisite, as for croup, and the surgeon, rather than lose his patient, will furnish an artificial aperture for respiration, by opening the trachea. Sometimes also from the carelessness of their attendants, peas and other similar substances may slip from the mouth into the windpipe. Under such circumstances immediate aid is demanded. It is surprising how small substances have occasioned death from suffocation; while, on the other hand, large bodies have passed into the trachea or bronchi, and remained there for years, ultimately causing death by consumption. People have been known to perish from a blade of grass getting into the aperture of the windpipe; a case in Edinburgh terminated fatally by suffocation, caused by a piece of potato-skin caught between the glottis and the epiglottis, which acted as a closing valve. Tracheotomy (with a penknife, if no other instrument be at hand) is the best plan in cases of danger.

SYNCOPE, OR FAINTING.

This originates from an irregular or defective performance of the sensorial functions, from defective circulation of blood in the brain at the time that syncope occurs. In it perception is diminished or suspended, the pulse stops or can scarcely be felt, the action of the heart and lungs is feeble and imperfect, and the utterance is gone. It may arise from exhaustion, such as, after fatigue, long fasting, &c., from acute pain, from some sudden and intense passion or emotion of the mind, or from excessive discharges or hæmorrhages. It is frequently caused by the flatulence common to persons labouring under indigestion. The fit generally ceases after a few minutes, when the person becomes sensible of what is going on around him.

When a person is seized with a paroxysm of this nature, he ought to be conveyed into the free air, and cold water should be sprinkled on his face, and poured down his throat. Pungent odours should also be held under his nose, such as aromatic vinegar or hartshorn. He should be laid in a recumbent position, and the feet and hands rubbed with spirits, or any strong stimulant. If the patient be placed in the sitting posture, the head should be bent down between the knees, but the recumbent position is the best. As soon as he can swallow, recovery will be expedited by taking a glass of wine, or spirits and water, or fifteen drops of ether and the aromatic spirit of ammonia. The occurrence of

syncope during hæmorrhage arrests the bleeding for the time, and is one of the means adopted by nature to effect that object.

COUP DE SOLEIL.

This is an accident which, though not altogether unknown in this country, is considered as almost peculiar to warmer latitudes. The symptoms vary according to the severity of the affection. Sometimes the person falls down suddenly, and soon expires, as is frequently the case during marches in hot climates. At others the attack is preceded by violent headache, the eyes becoming dry and inflamed, with a desire to keep them closed, or a convulsive movement of the upper eyelid. Some cases are attended by coma, or violent delirium, high fever, nausea, and great prostration of strength. In some, the face is scorched and disfigured.

From these symptoms it would appear that the primary cause of this affection is intense heat, producing a determination of blood to the brain; in some cases, ending in apoplexy; in others, in inflammation of the brain. People expose themselves to it when they sleep in the sun with their heads bare. It may also be induced by any great heat

applied directly to the head.

The progress of this affection is so rapid, that it is generally fatal in tropical climates. When life is not at once extinguished, bleeding should be employed freely. Louis XIV., when thus attacked, only recovered after being bled nine times. When, by such means, some impression has been made, cold applications to the head, after it has been shaved, cupping, and a large blister on the nape of the neck, with purgatives, and revulsives to the extremities, are necessary.

DRUNKENNESS.

When a person is conveyed home in a state of deep intoxication, he should be placed in a large and well ventilated room, and none should be allowed to remain except those who are absolutely necessary. He should be laid in a recumbent position, with his head a little to one side, to favour vomiting, which should be excited by tickling the back part of the throat with a feather, or, if that fail, by an active emetic, such as a dessert-spoonful or more of the flour of mustard (pulv. sinap.). This should be followed by an injection of common sait. If nausea and vomiting continue,

after the contents of the stomach have been evacuated, effervescing draughts of soda or Seidlitz water are to be administered.

To remove the stupor, cold water may be dashed on the face, and applied freely to the head by means of cloths. This should be practised as speedily as possible, as it is said to aid the action of the emetic. When the insensibility and lethargy are great, and do not go off, but are apparently on the increase, and the breathing is stertorous, then bleeding, either from the temporal artery, the arm, or jugular vein, will be advisable, the practitioner being guided as to the quantity of blood he should abstract by the intensity of the symptoms, the character of the pulse, the state of the constitution, the habits and age of the sufferer, and the impressibility of the system, as manifested by the symptoms which arise during the bleeding.

CONVULSIVE PAROXYSMS.

The convulsive fits of children may be induced by a disordered state of the bowels, or by teething, or may make their appearance towards the fatal termination of chincough, or of water in the head. The convulsive motions may be general or partial, and are extremely rapid, the hands and legs being agitated in every direction. The body is bent back, the features distorted, the cyclids either open, or opening and shutting rapidly, and the eyes either fixed or rolling in their sockets. The duration of the fit may be from a few minutes to several hours.

When a child is affected in this manner, very active means should be employed, since there is much danger of the fit proving fatal. The best remedy is the warm bath, in which the child is to be placed, and retained till the fit goes off. It must not, however, be unnecessarily repeated. The cold bath, exposure to a current of cold air, and sprinkling cold water on the face, have all been severally found useful in shortening the fit. In every case, purgatives and an injection, where it can be conveniently given, are proper. In the generality of cases, leeches to the temples, and a blister to the back of the head and neck, are demanded. When the fits appear to be connected with flatulence, carminatives may be given. In all cases of fits in children, the state of the mouth should be carefully examined, and if the gums feel hard and swollen in any part, the

mouth hot, &c.; in a word, if the symptoms indicate that the process of dentition is going on, it becomes a matter of absolute necessity that the gums should be freely lanced, and that not once only, but repeatedly; daily, or even twice daily has been necessary in some instances to prevent or to remove the cerebral irritation that has been thus excited. This operation, so slight in itself, in cases to which it is applicable, is of far greater importance than leeching, blistering, or the use of drugs, whether they be exhibited by the mouth or by the anus.

HYSTERIC PAROXYSM.

The hysteric fit seldom comes on without some premonitory signs; such as palpitations, flatulence, sickness, depression of spirits. &c. A sense of fulness or pain is felt in the left side, which gradually mounts up to the throat, occasioning the sensation as if a ball (globus hystericus) were there, threatening suffocation. The patient then falls down, and the convulsive action commences. The body is twisted, the hands are clenched, and beaten incessantly against the breast, the person rolls on the ground, and screams and laughs involuntarily. When the fit ceases, the patient continues for some time in a stupid and half insensible state. During the fit, cold water, vinegar, or Hungary water, may be sprinkled on the face, pungent applications made to the nostrils, the hands opened and rubbed, feathers burnt under the nostrils, and warm friction applied to the extremities. If the patient can swallow, half a teaspoonful of ether, with a few drops of laudanum and tincture of castor or assafætida, or a teaspoonful of the aromatic volatile spirit, in any aromatic destilled water, may be administered.

APOPLEXY.

When a person falls down in a fit of apoplexy, stimulants should not be applied to the nostrils, nor any strong liquor forced into the stomach. The body should be immediately raised to an erect or sitting posture, and the head supported so as to prevent any bend in the neck. The neckcloth should be loosened as well as the other clothes, and he should be allowed to breathe free cool air. If the patient be seized after eating or drinking, and be inclined to vomit, that action should be promoted if there be not great turgidity and flushing of the face, when blood-letting will be previously requisite,

followed by powerful purgatives, as croton oil, calomel, and jalap. The former is very serviceable when the power of deglutition is apparently lost, as it can be dropped into the mouth, combined with sugar, and will be absorbed, and its action obtained, when more bulky and less useful purgatives may be rejected. Shaving the head, or cutting the hair short, and the application of cold lotions to that part, with revulsives to the extremities, are also useful, as also may stimulant enemata prove. Great caution, however, is needed against being too hasty with the lancet, unless there be an evident determination of blood to the head, for otherwise it might do much harm, and even prove the means of loss of life, or at least may cause the occurrence of paralysis, which, perhaps, the sufferer might otherwise have escaped.

EPILEPSY.

During the fit, care should be taken that the patient do not injure himself in any way, by the violence of his strug-His clothes should be generally loosened, the head elevated, and a piece of wood put between the teeth. No cup or glass ought to be given him to drink from till the convulsive delirium has subsided, as he might bite a piece from such vessels, and thus injure his mouth. When it has been caused by drinking strong liquors, an emetic will always remove the fit. Bleeding, in many cases, is of advantage; but this must depend on the circumstances, such as evident signs of determination of blood to the head. redness and flushing of the face, a strong and full pulse, &c. It should be effected from the temporal artery or from the Where the countenance is pale, the pulse small, and the patient weakly, powerful antispasmodics may be given in the form of enemata. After the fit has passed away, antispasmodics and the mineral tonics are usually employed to prevent a relapse; but the causes of epilepsy are very numerous and varied, and until the cause of each respective case has been discovered, the treatment for its relief or cure can but be empirical.

THE POISONS.

THERE are an immense number of substances derived from the three kingdoms of nature, which possess deleterious properties; some of them, from their resemblance to others of an innocuous or beneficial nature, have been taken inadvertently; others, again, have been administered accidentally, or without design; comparatively few are employed with the intention of committing murder, those poisons, in the generality of instances, being used, which can be readily procured, and the effects of which are most rapidly evinced. Slow poisoning has been almost, if not entirely, banished from the criminal calendar. Whether the noxious ingestum be administered with a murderous object, or through ignorance or neglect, it is equally the duty of the medical practitioner to be aware of the effects to which it may give rise, and to be acquainted with the means to be adopted for their removal. In all cases where the evacuation of the poison is practicable, the stomach-pump should be had recourse to.

Poisons are obtained from the animal, vegetable, and mineral kingdoms, and may be divided into narcotic, narcotico-acrid, acrid, corrosive or escharotic, and astringent.

In the class of narcotic poisons, we find opium, (morphia, narcotine,) hyoscyamus, lactuca, solanum, hydrocyamic acid, (and all agents containing it, more especially laurel-water, bitter almonds, cherry-laurel, peach cluster or bird-cherry, and mountain-ash,) alcohol, certain gases, &c. The general characteristic symptoms which are produced by the exhibition of this class of poisons, are, giddiness, headache, dilated pupils, imperfect vision, drowsiness, stupor, or insensibility, full pulse, and desire to vomit; followed by delirium, partial paralysis or convulsions, then coma, feeble pulse, and death. The sufferer can generally be roused from the state of stupor for a short time, by loud noises or by injecting water into the ear, but speedily relapses on

the withdrawal of the exciting cause. The peculiar symptoms produced by opium, morphia, and narcotine, scarcely differ from those above detailed: the pupil, however, is as frequently contracted and sluggish, as dilated; the autopsic appearances presented in a case of poisoning by opium, or its salts, are congestion of the vessels of the brain, with effusion of serum, and a fluid state of the blood. As has been already observed, the stomach-pump should be had recourse to, for the removal of the poison, in preference to emetics: stimuli should be administered afterwards, such as brandy, strong coffee, &c.; the douche, cold aspersion, sinapisms, and ammonia, rubbed over the epigastrium, and over the region of the heart, will be found to be valuable adjuncts. In cases where some time has elapsed since the poison was taken, and the coma is profound, flogging with nettles, and the application of galvanism, well kept up or repeated from time to time, have been found sufficient to rouse the vital energies. Bouchardat, in such cases as are under notice, recommends the removal of the contents of the stomach by emetics, when practicable, if not, by using the stomach-pump, and by the exhibition of the following medicine:

B. Iodinii, gr. iv. Potassii iodid. gr. viij. Aquæ destill. f

xvj. Solve.

In other respects his advice coincides with the directions already given. Strong coffee given by the mouth and in enemata, counter-irritation externally, flagellation, and electricity, are the measures he chiefly depends upon. is essentially necessary that the patient be kept constantly roused for some time after the ingestion of the poison, and even when allowed to yield to the soporific influence of the drug, care must be taken that the sleep be not too profound. These directions will be found of service in all cases of narcotic poisoning. Tannin is considered to be a valuable antidote in cases of poisoning by morphia or any other alcaloid, as it combines with them and forms an insoluble compound (Lachèse). The internal administration of vinegar is dangerous. Cerebral congestion, should it supervene, is best combated by venesection, purgatives, low diet, &c., but bleeding must not be practised, until the poison has been fully evacuated, as it would otherwise

favour absorption. The ingestion of hyoscyamus is attended with active delirium and sardonic laughter, previously to the supervention of coma; and towards the termination of the case, petechiæ make their appearance. Ammonia and chlorine form the best antidotes in cases of poisoning by hydrocyanic acid; the cold water douche over the head and face and the nape of the neck has lately been strongly recommended (Beck). The Messrs. Smith, of Edinburgh, recommend a sulphate of iron, consisting of four parts of the persulphate and three of the protosulphate, combined with a proper proportion of an alcaline carbonate, as an efficient antidote. They say that it neutralizes the hydrocyanic acid. and converts it into Prussian blue. The antidote should be exhibited in a large excess, as proportioned to the quantity of poison taken. 210 grains of the ferruginous salt, and 144 grains of the carbonate of potash, will neutralize 56.8 grains of real hydrocyanic acid. The antidote should be given in the proportion to the poison as 3 to 1. On examination after death, the blood is generally black and fluid, exhaling a strong prussic acid odour, and there is also cere-The eve presents a remarkably glistening bral congestion. appearance. Nightmen and others, who are employed in cleansing cloace and the common sewers, are exposed occasionally to great danger from the disengaging of sulphuretted hydrogen, which induces difficult breathing, insensibility, and asphyxia, with a dilated pupil, cold skin, and feeble pulse, followed by death. The autopsic appearances are. fluidity and blackness of the blood, dark colour of the internal vascular organs, loss of muscular contractibility, and great tendency to putrefaction. Where there is a possibility of restoring suspended animation, cold aspersion, pure air, and the use of chlorine are indicated. Wherever danger is expected from the state of a cloaca, chlorine should be freely thrown into it, previously to its being opened, as it decomposes the lethal gas. Carbonic acid gas occasions a sensation of weight in the head, giddiness, imperfect vision, feeling of terror, and palpitations, followed by insensibility, complete stupor, and death. The countenance is sometimes pale. and always composed. On examination after death, the cerebral vessels are found gorged with black fluid blood, the heart and great veins are in the same condition; the lungs are distended, the eyes glistening and prominent, the face red, and the tongue protruded and black. The limbs are flaccid. The treatment hitherto found most successful, is the occasional use of the cold aspersion, moderate bloodletting, and artificial respiration. The cases of death from deleterious gases in the grave in Aldgate churchyard, and from foul air in wells, which occurred of late years, have drawn public attention more particularly to this cause of death. Cases of poisoning by carburetted hydrogen, carbonic oxide gas, sulphurous acid gas, nitrous oxide gas, cyanogen, or arseniuretted gas, are not very likely to occur, except in the laboratory of the chemist.

The list of the narcotico-acrid poisons contains belladonna, stramonium, tobacco, the bladder-podded tobacco (lobelia inflata), conium, cicuta virosa, ænanthe crocata, athusa cynapium, aconitum napellus, veratrum, colchicum, digitalis, upas tieùte, nux vomica, strychnia, strychnos Sancti Ignatii, brucia, camphor, cocculus indicus, the fungi, &c. These have been subdivided into orders, according to the specific symptoms which they produce. In the first are placed belladonna, stramonium, tobacco, and lobelia; the two former cause extravagant delirium, with dilated pupil, risus sardonicus, and coma; the latter induce vomiting, faintness, violent convulsions, coma, and death. Congestion of the head, and fluid condition of the blood are generally found in cases of death resulting from poisoning by belladonna or stramonium. As in all such cases, the first indication is to remove the poison from the stomach; if the after-symptoms of congestion be urgent, bleed; purgatives are almost always necessary. Where tobacco or lobelia has been taken, stimulants are required. Numerous cases of poisoning by lobelia have occurred of late, it being the principal ingredient used by a Dr. Coffin and his illiterate agents in the compound he employs as curative of all diseases. Although lobelia, in certain cases, and in small doses, be a useful medicine, nevertheless, in the hands of his agents, and in the large doses in which they give it, it has proved dreadfully destructive to life. The leading symptoms produced by the umbelliferæ, comprising conium, cicuta virosa, ananthe crocata, and athusa cynapium, are delirium, convulsions, and coma. The two latter induce considerable irritation: cerebral congestion is very frequently the result of the ingestion of these poisons. Aconite induces vomiting, faintness, convulsions, maniacal delirium, stupor, and death. It appears to cause congestion of the internal vascular organs. Tannin and the decoction of galls are recommended by Meyer as antidotes to conium, after

the stomach has been freely relieved by a sulphate of zinc emetic. Colchicum, * veratrum, and digitalis induce great faintness and depression, feeble pulse, confusion of ideas, imperfect vision, delirium, convulsions, coma, and death. After the removal of the poison, stimulants are requisite. Nux vomica, strychnia, strychnos Sancti Ignatii, upas tieute, and brucia, cause violent general spasm, often amounting to tetanus, during a paroxysm of which the patient generally expires. They prove rapidly fatal, and destroy life in a small dose. The immediate evacuation of the poison is of the greatest importance; tannin is said to be an antidote for strychnia; venesection and opium have been recommended to relieve the tetanic spasm. Sandras and Bouchardat recommend tannic acid and decoction of galls as antidotes for strychnia and brucia, and for the plants of which they are the active ingredients. M. Duclos asserts that negative electricity has proved of service in poisoning by strychnia, whereas positive electricity has been injurious. Other experiments would serve to show that both qualities of electricity are equally injurious. Camphor and cocculus indicus produce a similar train of symptoms, but with more decided narcotism.

The ACRID POISONS are nitre, bryony, gamboge, stavesacre, sowbread, scammony, croton tiglium, elaterium, savine, &c. The general symptoms produced, characterize inflammation of the alimentary canal, either in its whole extent, or in some particular parts. The remedial indications are, the removal of the poison, the antiphlogistic plan of treatment, and the free exhibition of demulcents. The principal of these poisons cause vomiting, by which they are sometimes evacuated, and hyper-catharsis; nitre induces irritation of the urinary apparatus, and violent strangury. The ACRID poisons derived from the animal kingdom are, the cantharis,

^{*}A recent investigation before Mr. Carttar, the coroner for Surrey, will show the danger of taking a large dose of colchicum, unadvisedly. The deceased had taken a wineglassful of the tinct. sem. colch., to relieve the effects of intoxication, the result being death on the second day. The late Mr. Lalor Shiel also lost his life in consequence of taking some preparation of colchicum, which he kept by him to relieve the paroxysms of gout, to which he was subject. His constitution being broken by disease, the dose taken—probably a large one—deprived him of life in the course of a few hours. A still more recent example of the danger attending the taking a large dose of colchicum, is afforded by the death of Mr. Hely, a country practitioner, who was poisoned by mistaking the wine of colchicum for sherry. His death occurred a few months since.

which induces great irritation and inflammation of the intestinal canal and urinary organs, with strangury and suppression of urine,—symptoms which are to be met by general bleeding, the warm bath, cupping on the loins or on the perineum, demulcents, and opium: oleaginous mixtures will do harm. The poisonous fish rank also among the animal acrids; they are the scomber cæruleo-argenteus, clupea thryssa, esox baracula, coracinus fuscus, sparus chrysoppus, scomber maximus, coracinus minor, scomber, balistes monoceros, meræna major, xiphias gladius, ostracion globellum, peaca marina, and trachinus vipera. Muscles and oysters have been sometimes found to be poisonous.

The class of the corrosive or eschabotic poisons is both numerous and important; viz. - Arsenic and its salts, salts of antimony, corrosive sublimate, salts of copper, nitrate of silver, the mineral acids, alcalies and their carbonates. some of the earths, oxalic acid, and phosphorus. Symptoms:—intense abdominal pain, colic, vomiting and purging, frequently with bloody evacuations; hot and dry skin, accelerated and hard pulse, occasionally tormina and tenesmus, difficulty of breathing, convulsions, and death. Arsenie is more especially marked by constant spitting, constriction of the pharynx, extreme irritability of the stomach, offensive stools, cramps, palpitations, syncope, clammy sweats, petechiæ, delirium, paralysis, and convulsions. Arsenic acts on the nervous system, the circulation, and the alimentary canal; death is caused by the suspension of the powers of the heart and brain (Brodie); in small quantities, from to a grain, it induces gastro-enteritis; in larger, as from one to two grains, nervous symptoms are superadded (Lachèse); it acts far more speedily in powder than in large pieces. On examination after death, redness and inflammation of the alimentary canal are generally, but not always, found, with occasionally effusion of lymph and ulceration. The treatment should be directed to effect the removal of the poison, to combat inflammation, and to support the constitution under the great depression which supervenes. The hydrated tritoxide of iron was introduced in 1834, by Bunzen and Berthold as a decided and valuable antidote: the experience of other physicians has since confirmed their statements. From a series of experiments instituted by Von Specz, it appears that the dose of the tritoxide should be ten times larger than the quantity of the poison which had been taken. The hydrated peroxide of iron, which has been so strongly recommended as an arsenical antidote, is said by Duflos to be absolutely powerless. He advises the exhibition of the liquid peracetate of iron. as much diluted as possible, as the best antidote that can be Sandras and Bouchardat think highly of the obtained. moist hydrated peroxide of iron, next of the dry hydrated peroxide, and also of the persulphate of the moist hydrated peroxide, as antidotes. The hydrated oxide of magnesia. and magnesia in a state of fine division, are considered useful in poisoning by arsenic or its compounds. The rust of iron and hæmatite, or red iron ore, have a similar influence, but are not so powerful. The diet must be mild and farinaceous for a long while after, as it should be in all cases of corrosive poisoning. Oxalic acid is a most fatal and rapidly destructive poison; chalk and magnesia are its best antidotes. The other corrosive poisons but seldom form the subject of medico-legal investigation. The decoction of the vellow cinchona, galls, oak or elm bark, will prove the best antidote where the salts of antimony have been taken. White of egg and milk, &c., are used when corrosive sublimate is the poison. M. Poumet, of Orleans, advises the protochloride of tin as an antidote for the bichloride of mercury, and also for its sulphate and nitrate. Messrs. Sandras and Bouchardat are of opinion that a mixture of powdered zinc and iron, -- iron reduced by hydrogen. -- and the persulphuret of the moist hydrated peroxide of iron, are serviceable antidotes in poisoning by the mercurial bichloride. These preparations are also recommended by them in poisoning by the salts of copper. Strong coffee, which immediately decomposes them, white of egg, milk, anything containing albumen, and, it is said, sugar, and the ferrocyanate of potash, are all recommended. Common salt acts in the same manner with the nitrate of silver; the mineral acids require a free use of the alcaline carbonates; the latter needing in their turn the administration of the vegetable acids.* The effects of barytes are best obviated by a solution of the sulphate of soda, or magnesia, and of phosphorus, by large dilution of the contents of the stomach, and by magnesia to neutralize the phosphoric acid as it forms.

In the weekly records of Births, Deaths, published Aug. 26, 1854, there is mentioned the decease of a female child, four months old, from ulceration of the skin, caused by the application of magkins previously scaled in a solution of shloring of imag.

The ASTRINGENT POISONS are the salts of lead. Of these Dr. A. T. Thomson says, the carbonate is the only salt which is really poisonous, the others producing dangerous symptoms only in proportion to their susceptibility to be converted into the carbonate; the nitrate, sulphate, and hydrochlorate, &c., which cannot be decomposed by carbonic acid, are therefore innocuous; but the salts which are formed by combination with a vegetable acid require a large excess of the acid to be present, to prevent the change taking place by the action of free carbonic acid in the stomach. The diacetate which is contained in Goulard's extract is especially liable to undergo this decomposition. Plumbers, painters, compositors, lead-smelters, and workmen in white lead factories, are more generally subject to colica pictonum, &c., than any other class of men, but the use of wines sweetened with litharge, rum destilled through a lead-worm, rain-water falling from, or collected on, a new lead roof, the use of water passing through lead pipes or kept in lead cisterns, &c., will occasionally produce it in others. Poisoning by lead is attended by the following symptoms: an astringent metallic taste in the mouth. nausea, vomiting, violent colic, the pain being most severe about the umbilicus, drawing in of the abdomen, followed by inflammation of the peritoneum, fever, hard pulse, paralysis, and death. In these cases of poisoning, physicians have often noticed a well-defined blue line on the margin of the gums round the teeth. It is not always present. principal, and almost the sole autopsic appearance is, contraction of the large intestines; sometimes they are much dilated, and occasionally marks of inflammation have been found. The sulphate or the phosphate of magnesia or soda should be administered in solution in cases of poisoning by the salts of lead, as a double decomposition ensues, and the resulting sulphate or phosphate of lead is inert. Carbonates should be especially avoided (A. T. Thomson). Messrs. Sandras and Bouchardat advise the persulphuret of the moist hydrated peroxide of iron. Bleeding may be had recourse to when inflammatory symptoms are present, and the bowels should be kept open by the sulphate of magnesia. &c.; calomel and opium are also of great service; opium or morphia alone is sometimes needed to allay the intensity of the pain. The paralysis may be combated by strychnia and galvanism, with purgatives, especially the croton oil. Among the animal poisons most to be dreaded, the prinPoisons. . 35

cipal is that which causes hydrophobia. Poisonous serpents are very rare in this country; the viper and adder only need be feared, in our fields and lanes; but it sometimes happens that death is caused by incautiously handling an imported serpent possessed of great virulence of poison. An instance of this occurred lately at the Zoological Gardens. where an attendant, bitten by an African Cobra, died soon after he was admitted into the hospital. The symptoms indicating that such an accident has occurred, are, a sharp pain in the wounded part, which soon extends over the limb or body; great swelling, at first hard and pale, then reddish, livid, and gangrenous in appearance; faintings, vomitings, convulsions, and sometimes jaundice; pulse small, frequent, and irregular: breathing difficult, cold sweats, impaired vision, followed by disturbance of the intellectual faculties. Inflammation, and often extensive suppuration and gangrene. may also be met with, and usually, unless the system be well supported, terminate in death.

Treatment.—A moderately tight ligature to be applied above the bite, and the wound left to bleed after being well washed with warm water; the actual cautery, lunar caustic, or butter of antimony, to be then applied freely to it, and the wound afterwards covered with lint, dipped in equal parts of olive oil and spirits of hartshorn. The ligature to be removed if the inflammation be considerable. Warm diluting drinks, and small doses of ammonia or hartshorn, to cause perspiration: to be well covered in bed; and a little warm wine given occasionally. In cases such as that which occurred at the Zoological Gardens, the part bitten should be excised and cauterized at once, and ammonia given freely: if possible, an atmosphere of ammonia should be created around the sufferer. If gangrene be threatened, wine may be given more freely, and bark should be had recourse to. Arsenic. the principal ingredient in the Tanjore pill, has been strongly recommended, but it can scarcely be of service, its action being so slow, that death would take place long ere it could excite any beneficial influence. Excision is seldom, if ever. necessary for the bite of the viper of this country.

Poisonous Fish.—Clupea Thryssa, Yellow Billed Sprat. Cancer Astacus, Sea Lobster. Cancer Ruricolus, Land Crab. Muræna Major, Conger Bel. Mytilus edulis, Mussel. Perca Venenata, Rock Fish, &c., &c.

Symptoms.—In an hour or two, or often in much less time, after eating stale fish, a sense of weight at the stomach

comes on, with slight vertigo and headache, heat about the head and eyes, and considerable thirst; often an eruption on the skin (urticaria), and in some cases death has happened.

Treatment.—An emetic should be speedily given, or in the absence of it, vomiting may be excited by tickling the throat with a feather, and taking large draughts of warm water. After full vomiting, an active purgative should be given, to remove any of the noxious matter that may have found its way into the intestines. Vinegar and water may be drunk after the above remedies have operated, and the body may be sponged with a similar fluid. Water made very sweet with sugar, to which either may be added, may be drunk freely as a corrective; a very weak solution of alcali has been recommended to obviate the effects of the poison. If spasms ensue after evacuation, laudanum, in considerable doses, is necessary. If inflammation occur, the usual means of removing it must be employed.

VENOMOUS INSECTS. Tarantula, Scorpion, Hornet, Wasp, Bee, Gnat, Gad Fly. Symptoms.—In general, the sting of these insects causes only a slight degree of pain and swelling, but occasionally the symptoms are more violent, and sickness and fever are produced by the intensity of the pain.

Treatment.—Hartshorn and oil may be rubbed on the affected part, and a piece of rag moistened with the same, or with sait and water, may be kept upon it till the pain be removed. A few drops of hartshorn may be given frequently in a little water, and a glass or two of wine may be taken. The sting may, in general, be removed by making strong pressure over it with the barrel of a watch-key.

CARTHABIDES. Spanish, or Blistering Fly. Symptoms.

---Nauseous odour of the breath, acrid taste, burning heat in the throat, stomach, and belly; frequent vomitings, often bloody, with copious bloody stools; excruciating pain in the stomach; painful and obstinate priapism, with heat in the bladder, and strangury or retention of urine; frightful convulsions, delirium, and death.

Treatment.—Vomiting to be excited by drinking sugar and water, milk, or linseed tea, very freely. Emollient enemata should be administered, and if symptoms of inflammation of the stomach, kidneys, or bladder, supervene, they must be subdued by appropriate treatment.

SALIVA OF RABID ANIMALS.

HYDROPHOBIA.

Symptoms.—At an uncertain interval after the bite, generally, however, between the 20th day and the third or fourth month, pain or uneasiness occurs in the bitten part, though the wound may have been long healed. Anxiety, uneasiness, languor, spasms, horror, disturbed sleep, difficult respiration succeed, and are soon very much increased; violent convulsions affect the whole body, hideously distorting the muscles of the face; the eyes are red and protruded, the tongue swells, and often hangs out, and viscid saliva flows from the mouth; there is pain in the stomach, with bilious vomitings, a horror of fluids, and impossibility of drinking them. All these symptoms are aggravated till the sufferer is relieved by death.

Treatment.—Hydrophobia is more easily prevented than cured; indeed, it is doubtful if ever it has been cured. Mercury, arsenic, opium, musk, camphor, acids, wine, vegetable and mineral alcalies, oil, various herbs, and many other remedies, whose effects are quite opposite, have been employed, but none can be relied on. Large blood-lettings, the warm and cold bath, injecting water into the veins, and almost every other remedial agent, have been tried without success. The cannabis Indica, and even fermented liquors, given until intoxication happens, have been strongly recommended, and tried with some apparent relief, but have hitherto failed to effect a thorough cure.

The bitten part should be completely cut out, and cuppingglasses applied over it, the blood being allowed to drain away as long as it will; this may be done even after the bite has healed, if the symptoms of hydrophobia have not yet appeared; the part should then be immersed in warm water, and after the most persevering ablution, caustic should be applied to every part of the wounded surface, after which it should be covered with a poultice, and suffered to heal by granulation.

Poisonous Mushrooms. — Agaricus piperatus, Pepper Agaric. Agaricus nicator, Deadly Agaric. Agaricus chantarellus, Champignon. Amanita Muscaria, Fly Agaric.

Agaricus semi-globatus, Glutinous Agaric. Agaricus bulbosus, Bulbous Agaric.

Symptoms.—Nausea, heat, and pain in the stomach and bowels, with vomiting and purging; unquenchable thirst, convulsions, faintings, cramps of the lower extremities; pulse small, hard, and frequent; delirium, dilated pupil, vertigo, and stupor, cold sweats, and death often closes the scene.

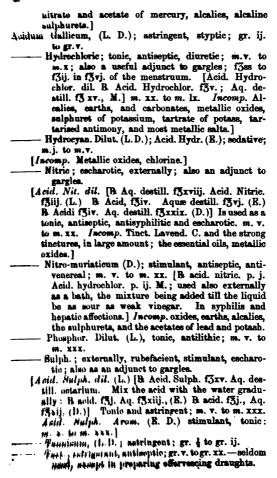

These symptoms rarely set in until six or eight hours after the mushrooms have been eaten.

Treatment.—The stomach and bowels to be first cleared by an emetic of tartarized antimony and ipecacuanha, or of sulphate of zinc or copper, followed by frequent doses of Glauber's or Epsom salts, and by large stimulating enemats. After the poison has been evacuated, where may be administered with small quantities of brandy and water, but if inflammatory symptoms should appear, the stimuli should be omitted, and other appropriate treatment had recourse to.

Remarks.—Poisonous mushrooms may be distinguished from those that are edible by their botanical characters, and by the following criteria:—The former grow in wet shady places, or in tufts and clusters from the trunks of trees, have a nauseous odour, are softer, more open and porous; have a dirty-looking surface, sometimes a gaudy colour, or many very distinct hues, particularly if they have been covered with an envelope; they have soft bulbous stalks, grow rapidly, and corrupt very quickly. Some of the poisonous Agarics have stems furnished with a collar or veil, are of an orange, red, or rose tint, or have a dirty glairy surface, or many distinct colours. The flesh of some turns blue when cut. An acrid taste and a pungent disagreeable odour also characterise the poisonous mushroom.

AN ABSTRACT OF THE THREE PHARMACOPŒIAS.

plasters. Absinthii fol. et summ. (L.); tonic, bitter, antispas., anthel-	•
mintic; Dj. to 3j.

Cassize Cortex (E.); stimulant, carminative; gr. v. to)j.

[Aq. Cassiæ, f3j. to f3ij.; Sp. Cassiæ, Tinct. Cassiæ, f3j. to f3ss.; Ol. Cassiæ, m.j. to m.v.]

Castoreum; antispasmodic; gr. v. to Dj.

[Tinct. Castor., Tinct. Castor. Co. (E.); m. xx. to f3iss.] Cataplasma Fermenti (L.); antiseptic.

[B. Farinæ lb. j. Cerevisiæ Fermenti, Aquæ ad 100° Calefactæ, sing. f3v. Mix the yeast and water, then add the meal, and expose to a gentle heat, until it begins to swell.]

Cataplasma Sinap.; stimulant, rubefacient.

[R. Pulv. Sinap., Pulv. s. Lini. Jiiss., Aque fervent., f3x. M. fiat catapl.]

Catechu Extr.; astringent; gr. v. to 3ss.

[Inf. Catechu (R.); Inf. Catechu C. (L. D.); f3ss. to

f3iss.; Tinct. Catechu (E.D.); Tinct. Catechu Comp. (L.); f3ss. to f3ij.; Pulv. Catechu C. (D.) 3ss. to 3j.; Conf. Catechu C. (D.); 3j. to 3iij.; Elect. Catechu (E.); 9j. to 3j.]

Centaurium (E.); in cold inf. tonic, stomachic; gr. x. to

[B. Inf. Centaurii; Centaur; 3vj. Aquæ frigid. Oj. fiat inf.; f3j. to f3ij.]

Cera (L.) demulcent, emollient; Dj. to 3ss., in form of emulsion.

Cetaceum; demulcent, emollient; gr. x. to 3j.

[Cer. et Ung. Cetacei; emollient, cooling; as dressing for wounds, burns, etc.]

Cetraria (L.E.); demulcent, nutritive, tonic; 3j. to 3iv. [Decoct. Cetrar.; f3j. to f3iv.]

Cerasus, Lauro-ceras. fol.; (D. E.); sedative.

[Aq. lauro-cerasi (D. E.); m. x. to f3j. for adults; m. ij. to m. vj. for children.]

Cerevisii fermentum (L. D.); stimulant, antiseptic; used chiefly as a poultice,—sometimes given internally in typhus fever.

Chimaphila (L. D.); diuretic, tonic, astringent.

[Decoct. Chimaph.; f3j. to f3ij.]

Chloroformyl.; sedative, anesthetic. m. v. to m. xxx. internally; used chiefly by inhalation, as an anesthetic.

Cinchonæ Cortex; tonic, febrifuge; gr. x. to 3ij.

[Decoct. Cinch., f3j. to f3iji, cold inf., f3j. to 3iij.;

Inf. Cinch. Spiss. (L.); f3ij. are sufficient for an f3viij. mixture; Tinct. Cinch., Tinct. Cinch. C., f3j. to f3ij. Extr. Cinch. flavæ, gr. v. to 9j.]

Cinchonia; tonic, febrifuge; gr. ij. to gr. vj.

Cinnam. Cortex; aromatic, carminative; gr. v. to 3ss.

[Ol. Cinnam., m. 88. to m. iij. Sp. Cinnam., Tinct. Cinnam., (L.E.), Tinct. Cinnam. C., f388. to f3iij. Aq. Cinnam.; f388. to f3iv. Pulv. Cinnam. C., gr. iij. to gr. xv.]

Cocculus (E. D.); stimulant, narcotic, poisonous; rarely used.

[Ung. Cocculi (E.); stimulant; in porrigo.]

Colchici Cormus et Sem.; diuretic, purgative, narcotic; gr. iv. to gr. x.

[Vin. Colch. (L. E.); m. xv. to f3j. Tinct. Sem. Colch. (L. E.); Tinct. Colch. C. (L.); m. xv. to

f3iss. Acet. Colch. m. xx. to f3j. (Incomp. Alcalies, earths, alcaline and earthy carbonates, sulphuric acid.) Extr. Acet. Colch., gr. ½ to gr. j. Extr. Colch. (L.) gr. ½ to gr. ij.]

Colocynthis: drastic purgative.

[Extr. Colocynth. (L. E.); gr. v. to 3ss. Pil. Colo. C., Pil Colo. cum Hyoscyam. (E.); gr. v. to 9j. Enema Colocynth. (L.) [R. Pil. Colo. C., 3ss; Saponis mollis, 3j. Aquæ 0j.; solve.] A stimulant purgative. Enema fætidum (E. D.); R. [Enema Colocynth. cum Tinct. Assaf. f3ij. M.]

Conf. Arom.; cordial, astringent; gr. x. to 3ss.

[Incomp. acids, metallic salts.]
Conii Fol.; narcotic, resolvent; gr. ij. to gr. vj.

Extr. Conii, gr. iij. to gr. x. Catapl. Conii. R. Extr. Conii, 3j. Aque f3x. P.s. Lini 5ivss. vel q. s. ut fiat catapl. Pil. Conii C. (L.); gr. iij. to gr. x. Tinct. Conii (L. E.); f3ss. to f3iij. Ung. Conii, a dressing for cancerous sores.]

Copaiba; stimulant, diuretic, purgative; m. x. to f3ij.
[Ol. Copaib. (L. E.); m. x. to m. xxx. Incomp.

nitric acid.]

Coriandri Sem.; carminative; Dj. to Dij.

Cornu Cervi (L. E.); nutritive.

Cornu Ustum (L.): absorbent; gr. x. to 3ss.

Creasoton; powerfully stimulant, astringent, sometimes sedative; m.j. to m.v.

[Mist. Creasoti, (E.); f3j. to f3ij.; Ung. Creasoti; a stimulant dressing, used in ringworm and as a counter-irritant.]

Creta Pp.; absorbent, antacid; gr. v. to Aij.

[Mist. Cretæ, f3j. to f3ij. Pulv. Cret. C., gr. v. to 3ss. Pulv. Cret. Comp. c. opio., gr. x. to 3ss.—

jij., contain gr. j. of opium.]

Crocus; stimulant, diaphoretic; gr. v. to 388.

[Syr. Croci, f3j. to f3iij; Tinct. Croci (E. D.), f3j. to f3iij.]

Cubeba; stimulant, diuretic, purgative; Dj. to Zij.
[Tinct. Cubeb. (L.D.); fZj. to fZiv. Ol. Cubeb. (D. E.);

m. iij. to m. xx. Ex. Sp. Cubeb. gr. v. to Dj.].

Cumini Semina: antispasmodic; seldom used.

[Emp. Cumini (L.); stimulant, detergent.]

Cupri Ammonio-sulph. (L. D.); tonic, antispasmodic; gr. 1 to gr. iij.

[Liq. Cup. Am. Sulph. (L.); used as a stimulant lotion. 1

Cupri Sulphas; tonic, emetic, astringent; externally escharotic; gr. ½ to gr. ij. in pills; as emetic, gr. ij. to gr. vj.

[Incomp. alcalies, earths, and their carbonates; borax; salts of lead; acetate of iron; astringent vegetable solutions and tinctures.]

Curcuma (L. E.); stimulant, tonic; 3ss. to 3iii.

Cusparise Cortex (L. E.); astringent, tonic, febrifuge; gr. v. to Di.

[Inf. Cuspar. (L. E.); f5ss. to f5ij. Tinct. Cuspar. (E.); Tinct. Angust. (D.); f5j. to f5iij. Incomp. Sulpl. ferri et cupri; nitras argenti, antim. potassiotart., acet. plumbi, bichlor. hydrarg., potassa, inf. gall.; inf. cinch. flavæ.]

Cydonium (L.); demulcent; in decoct. (L.) ad libitum.

[Incomp. Acids.]
Digitalis Folia; sedative, diuretic; gr. ½ to gr. ij.

[Inf. Digitalis; [R. Digit. fol. sicc. 3j. [3ij., D. R.] Sp. Cinnam., f3j. Aq. destill. ferv. f3xx. fiat inf.]; f3ij. to f3ss. as diuretic, f3j. to f3iss. as sedative. Tinct. Digitalis, [R. Digit., 5iv.—(5v. D.) Sp. ten. f3xl. fiat tinct.,] m. x. to m. xxx. Extr. Digitalis (R.) gr. ss. to gr. j. Pil. Digitalis cum Scillá (R.); one for a dose. Incomp. Acetate of lead; sulphate of iron; astringent vegetable solutions; carbonates of alcalies. Digitalis is apt to accumulate in the system.]

Dulcamara; diuretic, sudorific, alterative; gr. xx. to Dij.

[Decoct. Dulcam., f3j. to f3iij.]

Klaterium; hydragogue cathartic; gr. 18 to gr. 1.

[Extr. Elaterii (L. E.); gr. ½ to gr. j.]

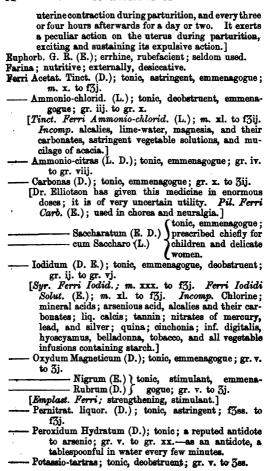

Rlemi: stimulant: seldom used internally.

[Ung. Elemi (L. D.); a stimulant digestive dressing.]

Ergota; stimulant, anti-hemorrhagic, emmenagogue; gr. v.

to gr. x.—3ss. during parturition.

[Decoct. Ergotæ. [R. Ergot: 3ss. vel. 3j. Aq. f3viij. ft. Decoct. eque per minutas x.] capt. f3ij. prodosi. Inf. Ergotæ (D.); [R. Erg. 3ij. Aq. bull. f3ix. Inf. per hor. j.]—f3ij., repeated every half-hour, if required, during parturition. Tinct. Ergotæ (D.), Tinct. Ergotæ Etherea (L.); m. xv. every three or four hours, in hæmorrhage; f3ss. to f3j. every half hour, to capase

[Incomp. potassii sulphuret.; infusions of oak-bark, galls, and other astringent vegetables.]

Ferri Pulvis (D.); tonic, deobstruent, and anthelmintic; gr. v. to Aj.

—— Sesquioxyd.; tonic, emmenagogue; gr. x. to 3ij.

[Incomp. Acids and acidulous salts.]

—— Sesquichlorid. Tinct.; tonic, antispas., emmenagogue, styptic; m. x. to f3ss.

[Incomp. Alcalies, lime-water, magnesia, and their carbonates, astringent vegetable solutions, and mist. acaciæ.]

—— Sulphas; tonic, anthelmintic, emmenagogue; gr. j.

to gr. v.

[Mist. Ferri C.; f3j. to f3jj. Mist. Ferri Ammon. (D.); f3ss. to f3jj. Pil. Ferri Comp. (L.); Pil. Ferri Sulph. (B.); gr. v. to 9j. Incomp. earths, barii chlorid., calcii chlorid., alcalies and their carbonates, borax (sodæ biboras), argenti nitras, acetas plumbi, soaps, tannin, &c.]

—— Sulphuretum (D. E.); nauseating, emetic; m. ij. to

m. v.
—— Valerianas (D.); tonic, antispasmodic; gr. ss. to gr. iij.
[Incomp. acids, astringent vegetable extracts.]

Ferrugo (E.); an alleged antidote to arsenic; 3j. frequently repeated.

Ferrum (E. D.); tonic, deobstruent, anthelmintic; gr. v. to pj. of the filings.

[Vin. Rerri, f3iij. to f3j.]

Ficus; nutrient, emollient, laxative; locally suppurative. Filix mas (E.); anthelmintic; 3j. to 3iij.

Fœnic. Sem.; carminative, diuretic, gr. x. to Dj.

[Aqua Fænic.; f3j. to f3jij. Sp. Fænic. (D.); m. xx. to f3j. Ol. Fænic. (L.), m. j. to m. iij.]

Galban. G. R.; antispasmodic, expectorant, discutient; gr. v. to)j.

[Pil. Galb. C. (L.); gr. v. to 3ss. Emp. Galban, Emp. Gummos. (E.); externally stimulant, discutient, &c.

Gallæ; astringent; gr. v. to 9j. Used principally in ointment.

[Tinct. Gallæ; f3j. to f3ij. Decoct. Gallæ (L.); f3ss. to f3ij. Ung. Gallæ (D.); Ung. Gallæ C. (L.); Ung. Gallæ c. Opio (E.); astringent, used chiefly for hemorrhoids. Incomp. liq. calcis, potass. carb., plumbi

acet., cup. sulph., argenti nitras, ferri sulph., ferri iodid., antim. potassio-tart., hydrarg. nitras, hydrarg. bichlor., inf. cinchon., sol. ichthyocollæ et opii.]

Gentianæ Radix; tonic, stomachic, antiseptic; gr. v. to Dj.

[Inf. Gentian. (E.); Inf. Gent. C. (L. D.); f3ss. to f3ij. Mist. Gentian. C. (L.); tonic and aperient; f3j. to f3ij. Extr. Gentian; gr. v. to Dj. Tinct. Gentian. C., f3j. to f3ij. Vin. Gentian. C. (E.); f3ji. to f3vj. Incomp. Acet. plumbi.]

Glycerina (D); emollient; externally in eruptions; said to be of service in a dry state of the meatus audi-

torius externus.

Glycyrrh. Radix.; demulcent; 3ss. to 3j.

[Decoct. Glycyrrh. (D.); f3j. to f3iv. Ex. Glycyrrh. ad libitum.]

Granati Cortex; astringent, anthelmintic; Dj. to Dij.

[Decoct. Granati (L.), Decoct. Granati rad. (L.);
f3ss. to f3j. Incomp. sulph. ferri, ferri iodid.,
argenti nitras, plumbi acet.]

Guaiaci Res. et Lign.; stimulant, diaphoretic; gr. v. to Dj. [Mist. Guaiaci (L. E.); f3ss. to f3iss. Tinct. Guaiaci, (E. D.), Tinct. Guaiaci Comp. (L. E.); f3ss. to f3j. Decoct. Guaiaci (E.); f3iij. to f3vj. Incomp. the mineral acids.]

Hæmatoxyli Lign.; astringent; used in decoction, f3ss. to f3ij.

[Ext. Hæmatoxyli (L. E.); gr. v. to jij. Decoct.

Hæmatoxyli; f3ss. to f3ij. Incomp. the mineral
acids, acetic acid, solutions of alum, sulphates of iron
and copper, acetate of lead, antim. potassio-tart.,
opium, dec. cinch. flav., alcalies and their carbonates,
magnesia, and carb. of lime.]

Helleb. Offic. Radix (L. E.); drastic cathartic, emmena-

gogue; gr. iij. to gr. x. Seldom used.

[Tinct. Helleb. (L.); f3ss. to f3j.]

Hemidesmus Indicus (D.); demulcent, diaphoretic, tonic; a substitute for sarsaparilla.

Hordeum; demulcent, nutritive.

[Decoct. Hordei (L. D.), Decoct. Hordei Co. (L.), Mist. Hordei (E.); ad libitum.]

Hydrargyrum.

[Pil. Hydrarg., alterative, antisyphilitic; gr. v. to
Dj. Ung. Hydrarg.; antisyphilitic, discutient; 3ss.
rubbed in night and morning. Cerat. Hydrarg. C.,

ARTIFICIAL MINERAL WATERS.

NATURAL Mineral Waters constitute an important part of the agents for removing disease. The difficulty which exists of procuring them, and the changes to which they are subject in the depôts where they are preserved, have given rise to the idea of making artificial waters, but the actual state of science does not enable us to imitate accurately the waters of the majority of the springs; whether it be that chemial analysis leaves a doubt as to the nature of their component parts, or as to the mode in which they are combined, or that these waters contain principles which art has not yet been able to produce, is still uncertain. As, however, tless artificial waters form part of the kingdom of the materia medica, and are of great use in curing disease, it may not be unadvsiable to give certain formulæ for their preparation, some of which have been already consecrated by use, and in the others are comprised the principal varieties of the most ordinary mineralizers of springs. By acting in accordance with their chemical analysis, imitations of the waters of other natural mineral springs, more or less accurate, may be obtained.

Mineral waters are called saline, when they hold a strong proportion of salts in solution; acidulated, when they are charged with carbonic acid gas; ferruginous, or ioduretted, when iron or iodine is contained in them in sufficient quantity to give them a marked character; sulphurous, when they are mineralized by sulphuretted hydrogen or an alcaline sulphuret.

The preparation of saline waters consists in a simple solution of the salts in water: acidulated waters are made with carbonic acid gas, which has been carefully washed to remove all traces of any other acid; as the water must contain a larger proportion of the gas than is soluble in it under ordinary circumstances, a proper apparatus must be employed for the purpose. When it is requisite to combine the saline and acidulous waters, it may be done either

by dissolving the salts in water, and then charging it with the gas, or by making a concentrated saline solution, and putting it into a bottle, which is afterwards to be filled up with the water charged with gas. When insoluble carbonates are required in a mineral water, they must be used in the gelatinous state in which they are found on their production by double decomposition in water, as carbonic acid gas will more readily act on them. If by a double exchange of acids and bases, the salts directed in the formulæ can be all theoretically transformed into soluble salts, this substitution should be effected; then, at the moment of mixing the different saline solutions, the primitive formula is realized: the insoluble carbonates are produced and precipitated, and redissolved at a later period by the carbonic acid gas. An example of this kind will be found in the saline acidulated water, used to replace the natural EAU DE In the preparation of ferruginous mineral waters. water deprived of air must be employed; it may be obtained by boiling water for a quarter of an hour, and letting it cool, without being exposed to the air. The presence of oxygen in the water would cause the iron to pass to the state of peroxide, which would be precipitated in a great measure. either as an hydrate or an insoluble salt. Sulphur is introduced in mineral waters, either as a soluble sulphuret, generally of sodium, or combined with hydrogen. In preparing this latter, a saturated solution of gas should be employed: in this state it is much too concentrated, and should be diluted with water, for the preparation of artificial sulphurous waters. As the alcaline sulphurets are exceedingly soluble, their introduction in mineral waters does not offer any difficulty.

AQUA ACIDULA SIMPLICIOR.

R. Aquæ puræ 1 vol; acidi carbonici 5 vol. Charge the water with the gas by means of a proper apparatus, and fill bottles with it, each containing about 20 oz.: they must be very accurately corked, and kept lying down in a cool place. By adding two ounces of syrup of lemons to each bottle before the gazeous water be added, a very agreeable drink may be obtained, called gazeous lemonade. By changing the syrup, a great number of acidulated and saccharine drinks may be procured.

ARTIFECIAL RAU DE SEATE.

R Chlorureti calcii gr. vj.; chlorureti magnesii gr. v.; chlor. sodii gr. xx.; carb. sodie cryst. gr. xvj.; phosph. sodie cryst. gr. i.; aque pure f5xx.; acidi carbonici 5 vol. Dissolve the sodnic salts in one proportion of water, and the earthy chlorurets in another; mix the liquors, and charge them with gas; the gazeous saline water which is the result, should be poured directly into bottles, and well stoppered. It is intended to replace the natural Ran de Seltx; it contains more carbonic acid, and is therefore often preferable.

AQUA ACIDULA CUM BICARR, POTASER.

B. Bicarb. potasse jiv.; aque pure f5xx.; acidi carbonici 5 vol. Dissolve the salt in water, charge with the gas, and bottle. Each ounce will contain about four grains in solution.

SODA WATER.

R. Bicarb. sodse gr. xx.; aquse purse f5xx.; acidi carbonici 5 vol. Prepare as the preceding.

ARTIFICIAL RAU DE VICHY.

B. Carb. sodæ cryst. 3ij. gr. vj.; chlor. sodii gr. \(\frac{1}{3}\); chlor. calcii cryst. gr. xi.; sulph. sodæ cryst. gr. vj.; sulph. magnes. cryst. gr. iij.; sulph. ferri cryst. gr. \(\frac{1}{3}\); aquæ aere orbatæ f\(\frac{5}{2}xx\); acidi carbonici 3\(\frac{1}{3}\) vol. Make a solution of the sodaic salts, another of the sulphate of magnesia, and a third of the chloruret of calcium; mix, and charge with the gas; then pour into bottles, in which the sulphate of iron dissolved in a little water has been previously introduced. This water differs essentially from the natural Rau de Vichy in the absence of organic matters.

ARTIFICIAL EAU DE MONT D'OR.

B. Carb. sodæ cryst. Zij. gr. xxiv.; chlor. calcii cryst. gr. viij.; chlor. magnesii cryst. gr. 1½; chlor. sodii gr. 1½; sulph. ferri cryst. gr. ij.; sulph. sodæ cryst. gr. 1½; aquæ aere orbatæ f zxx.; acidi carbonici 5 vol. Dissolve the carbonate of soda and the marine salt in water, and charge the solution with gas; make another solution of the earthy chlorurets and of the sulphate of iron, and mix; introduce

into bottles, and fill them with the gazeous saline water. Stopper quickly.

EAU DE BOURBONNE.

R. Bromureti potassii gr. §; chlorureti sodii gr. liv.; chlor. calcii cryst. gr. xxxviij.; sulph. sodæ cryst. gr. xxiij.; bicarb. sodæ cryst. gr. vj.; aquæ puræ fʒxx.; acidi carbonici 5 vol.

MAGNESIAN WATER.

Re Sulph. magnes. cryst. Zviij. gr. xxiv.; carb. sode cryst. Zx. gr. xlviij.; aque pure f\(\frac{7}{3} xx. \); acidi carbonioi of vol. Dissolve each of the salts separately in water, mix and boil the solution, keeping them boiling until gas is no longer disengaged; let them precipitate, decant, and wash the precipitate carefully, and let it drain; mix it with a sufficient quantity of water, and charge with the gas. It should not be bottled until several hours after the introduction of the gas, and during that time, should be occasionally shaken to favour the solution of the carbonate of magnesia. Rach bottle will contain two drachms 24 grains of white magnesia in the state of bicarbonate, with a slight excess of carbonic acid.

GAZEOUS MAGNESIAN WATER.

B. Sulph. magn. cryst. 3iv. gr. xij.; carb. sodæ cryst. 3iv. gr. liv.; aquæ puræ f3xx.; acidi carbonici 6 vol. Proceed as for the simple magnesian water. Each bottle of 20 ounces will contain one drachm gr. xij. of white magnesia in the state of bicarbonate, with an excess of carbonic acid.

ARTIFICIAL RAU DE SEIDLITZ.

R. Magn. sulph. cryst. 3ij. gr. xxiv.; aquæ puræ f5xx.; acidi carbonici 3 vol. Dissolve the sulphate of magnesia in water, charge with the gas, and bottle. The Kau de Seidlitz may be prepared with a larger quantity of the salt, each bottle to contain either twice, thrice, or four times as much.

ARTIFICIAL BAU DE SPA.

R. Carb. sods cryst. gr. iij.; carb. calcis gr. $\frac{3}{5}$; magn. carb. gr. $\frac{1}{4}$; proto-chlor. ferri gr. $\frac{3}{5}$; aluminis cryst. gr. $\frac{1}{7}$; aque aere orbsts $f_{\Sigma XX}$; acidi carbonici 5 vol. Dissolve the carbonate of soda in a small quantity of water, and mix the carbonates of lime and magnesia with the solution; dissolve

the alum and chloruret of iron in another portion of water, and mix the two solutions. Pass into bottles, and fill with the simple gazeous water. This preparation resembles the Spa waters, and also in some degree those of Bussang, Forges, Pyrmont, Vals, &c.

EAU SULPURÉE.

R. Sulphureti sodii cryst. gr. ij. ½; carb. sodæ cryst. gr. ij. ½; chlorureti sodii gr. ij. ½; aquæ aëre orbatæ f3xx. Dissolve and keep in well-corked bottles. This mineral water is used to replace those charged with the sulphuret of sodium, and is often used in lieu of the sulphurous waters of the Pyrenees, of which, however, it is but an imperfect imitation. It is employed indifferently under the names of Eau Minérale Artificielle de Barèges, de Cauteretz, de Bagnères, de Luchon, de Bonnes, de Saint Sauveur, or of any other sulphurous water of the eastern Pyrenees.

SOLUTION FOR THE ARTIFICIAL BAIN DE BARÈGES.

R Sulphureti sodii cryst., carb. sodæ cryst., chlorureti sodii, ana 3ij. 3iij. gr. vj.; aquæ puræ f3x. Dissolve the salts in water, bottling quickly, and corking carefully. It is to be mixed with the water in the bath when required. The quantity above indicated is sufficient for a bath containing 300 quarts. It gives a colourless bath, having a slight hydro-sulphurous odour, differing in every respect from the ordinary sulphurous bath prepared with the sulphuret of potassium obtained from sulphur and potass.

EFFERVESCING FEBRIFUGE POWDERS. (M. Mercier, of St. Gilles.)

B. Sulphatis quininæ gr. ij. Acidi tartarici 388.

Fiat pulvis—adde

Sodæ bicarbonatis gr. xxiv. Sacchari albi pulv. Ziiss.

Pro dosi, in aqua solvend, et ex statu effervescentiæ sumend.

The acid and alcaline packets may be dissolved separately, and taken as an ordinary effervescing draught. The excess of tartaric acid is directed to ensure the solution of the quinine, which is but slightly soluble in water only.

1

GAZEOUS FEBRIFUGE WATER. (M. Mercier, of St. Gilles.)

B. Quininæ sulphatis gr. xij. Acidi tartarici 3j. Sodæ bicarbonatis Điv. Sacchari pulv. 3j. Aquæ Oij.

The sugar and sulphate of quinine, dissolved with the tartaric acid, are first introduced into the bottle, and the bicarbonate of soda is next added, after which the bottle should be hermetically closed to prevent the escape of the gas. The dose is from half a glassful to a glassful every two hours. The manufacturers of artificial gaseous mineral waters may prepare a more simple febrifuge gazeous water by adding from ten to twenty grains of quinine, dissolved with tartaric acid, to a quart of water, and afterwards charging the fluid with five or six volumes of carbonic acid gas. The tartarized sulphate of quinine may be given in the same manner dissolved in Seltz water.

PROPORTIONS OF ACTIVE REMEDIES IN CERTAIN PHARMACEUTIC PREPARATIONS.

Quantity of Opium contained in different Preparations.

RULES FOR PRESCRIBING.

In prescribing a medicine, the following circumstances should always be kept in view:—age, sex, temperament, habit, climate, state of the stomach, the severity of the disease, and idiosyncrasy. The doses given in the preceding abstract of the Pharmacopoeia are intended for an adult

man, possessing a constitution of ordinary powers and capability of resisting disease and the influence of medicine.

Age.—For an adult, suppose the dose to be

				1		3j.
Under	1	year wil	l require	only 1	,,	gr. v.
,,	2	,,	,,	ģ		gr. viij.
,,	3	"	,,	1	,,	gr. x.
"	4	,,	,,	- ‡	,,	gr. xv.
"	.7	,,	"	\$		Ði.
"	14	"	,,	ģ		388.
A home	20	the full	dama ,,	\$	"	Địi.
Troate	41	me inn	uo se	1	. ,,	óì.

,, 65 the inverse gradation of the above.

Sex.—Women require smaller doses than men, and the state of the uterine system must never be overlooked.

Temperament.—Stimulants and purgatives more readily affect the sanguine than the phlegmatic, and the former

consequently are acted on by smaller doses.

Habits.— A knowledge of these is essential; for those who are in the habitual use of stimulants or narcotics, require larger doses to affect them when labouring under disease, whilst those who have accustomed themselves to the use of saline purgatives, are more easily affected by these remedies.

Climate.—Medicines act differently on the same individual in summer and in winter, and in different climates.

State of the stomach and idiosyncrasy.—The least active remedies operate very violently on some individuals, owing to a peculiarity of stomach, or rather disposition of body, unconnected with temperament. This state can be discovered only by accident or by time, but when it is known, it should always be attended to by the practitioner. Peculiarities of idiosyncrasy, however, are generally evidenced with the more potent remedies, such as the preparations of mercury and opium, very small doses of either of which will not unfrequently produce most extraordinary symptoms. This state is more frequently met with in women than in men, and is to be accounted for by the greater impressibility of the nervous system. Articles of diet occasionally produce very unpleasant symptoms, as shown by the effects of shell-fish in certain constitutions.

PRESCRIPTIONS

FROM AUTHENTIC SOURCES.

ALTERATIVES.

Those medicines which effect a gradual change in any morbid or faulty secretion, or tend to improve any diseased action by slow degrees, are denominated ALTERATIVES. The term is not quite free from objection, as all medicines are alterative in one sense or another; but as it is usually applied to the class of drugs about to be noticed, it is advisable in a work like this, not to make any change in it. Dr. Paris lays it down as an almost universal rule, "That when an alterative medicine acts with violence on the prime viæ, its energies are uselessly expended, and the object of its exhibition defeated." This, however, should be received with some hesitation, and not in the absolute sense in which it is thus laid down.

MIST. SALIN. cum POTASSÆ IODID. (Dr. H. Hunt.)

R. Magnes. Sulph. 3j.
Potass. Nitrat. gr. v.
Bicarb. 3ss.
Potassii Iodid. gr. ii.

Misce bene. To be dissolved in a tumbler full of warm water; one-third to be taken immediately on rising, and the remainder in twenty minutes; after which, a brisk walk to be taken for a quarter of an hour. Use—In atonic Indication.

UNG. HYD. CUM CRETA. (Quain.)

R. Hyd. cum Creta 3ss. Ung. Cetacei 3j.

M. ft. ung. Use — In simple ulceration of the rectum; the bowels being regulated by dietetic aperients, and the surface of the ulcer occasionally touched with the cupri sulphas.

MISTURA ALTERATIVA. (Blane.)

B. Hydrargyri Bichloridi gr. iv. Alcoholis f\(\frac{3}{2} \) viij. Tere et adde Vini Antimon, \(\pi_1 \).

Misce. Half an ounce twice a day. Use—In Syphilis and Chronic Rheumatism.

ANODYNES.—SEE NARCOTICS.

ANTACIDS OR ABSORBENTS.

These medicines act chemically, by neutralizing acids in the stomach and bowels, preventing or modifying their irritating effects, and in some cases producing a neutral purgative salt. They are little more than palliatives, unless combined with other treatment, such as may alter the disordered secretions, and remove them when morbidly accumulated.

Fiant pil. xxx. Two, twice daily. Use-In Chlorosis.

ANTHELMINTICS OR VERMIFUGES.

THE generation of worms in the human body, and consequently the modus operandi of vermifuge medicines, are still involved in mystery. Bitters have been, and still are by some, considered an absolute poison to worms. The truth is, that bitters invigorate the system, and consequently the alimentary canal, and prevent the accumulation of the slime and mucus, without which worms cannot live. The medicine which effects this most thoroughly is the best vermifuge, whether it remove the slime mechanically, by purging, as occurs with large doses of calomel, given every other night, followed by a black draught the succeeding morning, or whether it act by preventing its sccretion, as astringent and bitter tonics. Turpentine seems to act by killing the worms, as well as by its purgative quality, and the mucuna mechanically. A course of steel should follow the use of vermifuges.

Kousso, an Abyssinian remedy, has been much used of late years in this country and on the continent, as an anthelmintic in the treatment of cases of tænia, and in the majority of instances with great success, although some few cases of failure and others of relapse have been recorded. Cases have been published in which, while the body of the worm was readily expelled by the action of the anthelmintic, the head still remained in the primæ viæ, and consequently the formation of another worm and the continuance of all the annoying symptoms might fairly be looked for. It is, therefore, still a question whether the kousso be preferable in these cases to the older anthelmintics, such as the oils of turpentine and male fern.

Misce. Fiat bolus. Use-In Tapeworm.

ANTISCORBUTICS.

This term was formerly applied to medicines supposed to correct what were called Scorbutic Humours, the evidence of whose existence was inferred from cutaneous eruptions of almost every kind. The cress tribe ranked high as antiscorbutics, but it does not appear that they have any particular action independent of their stimulus. Fresh vegetables, the potato especially, fresh meat, the vegetable acids, as the citric and tartaric, change of air and scene, and in fact whatever will invigorate the frame, will act as Antiscorbutics.

ANTISEPTICS.

This term is applied to such medicines as possess the power of preventing animal substances from passing into a state of putrefaction, and of obviating putrefaction when already begun. It is extremely doubtful, however, that putrefaction ever occurs in the living body, though gangrene, necrosis, &c., approach to it. Most of the so-called Antiseptics may be classed in other sections. Antiseptics have been arranged under four divisions:—1. Refrigerating Antiseptics, as acids, which are principally adapted for the

young, vigorous, and plethoric. -2. Tonic Antiseptics, as cinchona, cusparia, camomile, &c., which are suited to almost every condition of the body, and are in general preferable to other antiseptics for relaxed habits. -3. Stimulating Antiseptics, as wine and alcohol, which are best adapted to the old and debilitated. 4 Antispasmodic Antiseptics, as camphor and assafeetida, which are to be selected for irritable and hysterical habits, &c. The peculiar circumstances of each case must also be taken into consideration in selecting the Antiseptic or combination of Antiseptics on which reliance is to be placed.

Table of the principal Antiseptics, and their Doses.

ENEMA CINCHONÆ. (Munro.)

R. Cinchonæ pulv. subt. 3j.

Lactis tepid. q. s. ut fiat enema.

To be injected evening and morning, or more frequently.

This injection is intended for children labouring under malignant small-pox. Previous to its administration, Dr. Alexander Munro, sen., directs the lower part of the intestinal canal to be emptied by a laxative injection.

As few children can be prevailed upon to take bark by the mouth in any form, there is, as Dr. Munro observes, often a necessity of using it in this way. If the enemata be retained too short a time, he recommends some syrup of oppies to be added; but a few drops of the tincture of opium are to be preferred. This mode of exhibiting bark will be found to be more serviceable, if the extract be used, as Dr. Lind recommends, instead of the powder, as noticed under tonics, where further remarks on the use of these injections will be made.

ANTILITHICS.

Antilithics are remedies (or alleged remedies) for calculus, but as they are more commonly called "Lithontriptics," they are placed under that head.

ANTISPASMODICS.

The modus operandi of the medicines strictly belonging to this class is not well understood. Their effect is to allay inordinate muscular action and violent pain, while they do not produce the insensibility and stupor attendant on the exhibition of narcotics.

When spasms arise from debility—stimulants, tonics, or whatever will remove this, will act as antispasmodics. When, on the other hand, they arise from irritation, as in the case of wounds, pregnancy, dentition, worms, bile, &c.,—narcotics, bleeding, or purgatives will prove antispasmodic.

Table of the principal Antispasmodics, and their Doses.

Aquæ ferventis f\u03e3viij.

A teaspoonful three times a day. This preparation Dr. Allnatt describes as invaluable in hooping cough, and far preferable to that of Wachtl, as it will keep a long time without changing, whilst the other becomes acid in a few hours, and consequently unfit for use.

BOLUS CAMPHORÆ cum SYR. PAPAV. (Brera.)

R Camphoræ gr. x. Acaciæ pulv. Dj.

Syr. papaveris albi, q. s.

" * Sumbul, a root recently introduced into practice by Dr. Granville, has been found very serviceable by those who have given it a trial. It has a decided musk odour, and gives out a powerful sharp aroma in the mouth, when masticated, heightened by its solution in any spirit. Chemical analysis shows that it contains traces of an ethereal oil, two balsamic ingredients (resins), one soluble in ether, the other in alcohol, also wax, an aromatic spirit, and a bitter substance, soluble in water and alcohol. The balsam seems to be the seat of the musk-like perfume; iss of it yield about ten grains of a crystallizable scid, which Dr. Reinsch has named the Sumbulic scid. Dr. Granville recommends the sumbul as useful in nervous diseases, spasms of the stomach, and cramp, hysteria and its varieties, chlorosis, amenorrhes and dysmenorrhes, paralysis of the limbs, epilepsy, and Asiatic cholers, even in the stage of cellapse. Dr. Reinsch states that in nervous atrophy its efficacy is undoubted; in low or nervous fevers succeeding typhus, Dr. Tillman and Dr. Richter have employed it with marked beneft; and Dr. Martigny, of Darmstadt, has found it beneficial in all those cases of dropsy which depend on impaired nervous orgasm.—(Dr. Growville on Sumbul, 1950.)

Tinct. Sumbulii f3j.

M. Two tablespoonsful twice or thrice a day.

APERIENTS.

Under this division only a few medicines will be mentioned, for the sake chiefly of easy reference, as they more properly rank under the head of CATHARTICS. Aperients, or laxatives, act for the most part by unloading the bowels of accumulated or offensive matter, without producing any considerable effect, either on the exhalent vessels of the intestines, or on the secretions of the liver and pancreas. They seem to act, therefore, by stimulating the muscular fibres of the intestines, so that their peristaltic motion is augmented, and the contents of the bowels more quickly and completely discharged.

Table of the principal Aperients, and their Doses.

i.

AROMATICS.

Medicines which are fragrant in smell, and usually warm to the taste, are called Aromatics. They are chiefly ranged in this work under the titles of CARMINATIVES and TONICS.

ASTRINGENTS.

The modus operandi of this important class of medicines appears to be in a great measure mechanical. They corrugate the fibres of the parts to which they are applied, and often act by sympathy on the more distant. There is no chemical test for the astringent principle; the taste must be the only criterion, and it is seldom deceived. They are principally used in restraining profluvia, such as epistaxis, fluxes, hemorrhage, gleet, and leucorrhea.

R Olei terebinth. f3j.—f3ij.—f3iij. Vitellum ovi unius Aquæ f3v.

Syr. flor. aurantii f3j.

M. ft. mist. The third part every three or four hours. Usr-In Hæmorrhages.

Dr. Smith recommends the addition of the muriated tincture of iron in epistaxis, depending on the rupture of one or more small bloodvessels, when much arterial blood has been lost. In hematemesis and hæmorrhage from the bowels, the turpentine may be given with the compound infusion of roses, sulphate of magnesia, iced-water, or solutions of tannic or gallic acid. In some forms of hæmoptysis, it may be usefully added to the infusion of matico; in hematuria, to the decoction of uva ursi, or chimaphila, or the muriated tincture of iron, &c. In purpura hemorrhagica, the decoctions or infusions of bark form with it an excellent adjuvant. It is compatible alike with acids and alcalies.

MIST. TEREBINTHINE. (Dr. Budd, of Bristol.)

R Ol. Terebinth. rect. f3ss.—f3iss. Creosoti gtt. iij. Sp. Rorismarini πxl. Mist. acaciæ f3iij. Aquæ ad f3iv.

Three tablespoonsful every three or four hours Use—In passive Hæmorrhages, Purpura, Epistaxis, Hæmatemesis, Metrorrhagia, Hæmaturia, &c. It is not so useful in active hæmorrhages, but it still may be of service. Mr. Griffiths, of Wrexham, has found half-ounce and ounce doses of the oil of turpentine effectual in the severe uterine hæmorrhage which sometimes follows parturition. The creosote prevents nausea, and, with the rosemary, covers the unpleasant flavour of the turpentine.

R Olei Terebinth. | mxxx.
Ex ovi vitello, | Tinct. Maticonis f3iss.
Aquæ Pimentæ ad f3iv.

M. ft. mist. A third part to be taken every three hours. Use—In Hæmatemesis. This combination was employed, and apparently with success, after the cleum terebinthines, the gallic and sulphuric acids, and the plumbi acetas had failed to be of service. Nevertheless Dr. Jenks expresses

doubts of the utility of the matico. It is worth a trial, however. In the case in which it was used, there were no signs of hepatic disease—blood was lost by hæmorrhoids as well as from the stomach.

PULVIS ASTRINGENS. (Hunter.)

R Aluminis purif. 9ss. Pulv. kino gr. v.

GARGARISMA ALUMINIS.

R Aluminis purif. 3ij. Decocti hordei 0ii.

Mellis rosæ f3ij.

Misce, ft. gargarisma. Idem.

GARGARISMA ALUMINIS cum CINCHONA. (Cooper.)

R Aluminis purif. 3j. Decocti cinchonæ f3xij. Mellis rosæ 3iss.

Misce, ft. gargarisma. Use—In relaxed state of the Uvula and contiguous parts.

SOLUT. ARGENTI NITRATIS. (Abernethy.)

R Argenti Nitratis Dj.

Aquæ destillatæ f3iij.

Solve, fiat gargarisma. Use—In Mercurial Salivation.

GARGAR. TEREBINTH. (Geddings.)

R Ol. Terebinth. f3ij. Mist. Acaciæ f3viij.

Misce, fiat gargarisma. To be used several times a day, in Mercurial Salivation.

GARGAR. ACIDI SULPH. COMP. (Pharm. Guyensis.)

R Infusi. lini f3xiv. Mellis rosæ f3ii.

Acidi sulph. dilut. f3iss.

Misco ft. gargarisms. Usr.—In cuses where mild Astringents are indicated, this will be found to answer very well.

GARGARISMA SIMPLEX. (Brodie.)

R Infusi rosæ f3iv.

Mellis rosæ vel syrupi mori f\(\)i.

Misce, ft. gargarisma.

PULVIS QUERCÛS cum ANTHEM. (Pearson.)

R Quercus cort. pulv. 3ss.

Anthem. flor. pulv. jj.

To be taken every second or third hour during apyrexia.

USE—In Intermittent Fevers.

BOLUS ASTRINGENS. (Gruner.)

R Aluminis,
Cinchonæ extr.
Myristicæ pulv.
Svr. simpl. q. s.

Fiat bolus. Use—In Intermittent Fevers.

PILULA PLUMBI ACETATIS. (Reynolds.)

R Plumbi acetatis gr. ss. Conf. rosse gr. iv. Tinct. opii mij.

Misce, fiat pilula una. One every four hours. Use—In Hamorhage from the Lungs, Uterus, and Nose.

MISTURA ZINCI SULPH. (Lind.)

R Zinci sulph. gr. xij. Aquæ destill. f3iii.

A third part three times a day, the dose being increased, if necessary, and the medicine be tolerated. Use—In Intermittent Fever.

MISTURA ASTRINGENS. (Pringle.)

R Ext. hæmatoxyli Ziij. Aquæ puræ f\(\frac{7}{3} \text{vij.} \)

Sp. cinnamomi f3j. Tinct. catechu f3ij.

Misce. Two tablespoonsful every four hours. Use—In protracted Dysentery.

GARGARISMA RHATANI.

R Tinct. rhatani f3iij. Mellis rosæ f3ii.

Mist. camphoræ f\(\)iiiss.

M. ft. gargarisma. Use—In Relaxed Uvula and Enlarged.

Tonsils.

UNGUENTUM ZINCI SULPH. (Klein.)

R Zinci sulph. Dj. Butyri recentis Zij.

Misce. A little to be applied night and morning to the affected eyelids. Usm—In Psorophthalmia.

PIL. ACIDI GALLICI CUM CANNAB. IND. (Pharm. Nosoc. Phthisic.)

R Acidi Gallici gr. iv.

Ex. Cannab. Ind. gr. j.

M. ft. pil. One or two for a dose. USE—As an astringent, combined with a sedative. In Colliquative Sweats.

GARGARISMA CORT. QUERCÛS CUM ALUMINE. (Cullen.)

R Quercus cort. cont. 3j.

Aquæ puræ Oiss.

Decoque ad octarium unum. Liquori colato adjice Aluminis 388.

Spiritûs tenuioris [3i].

Fiat gargarisma. Usz—In Atonic Swellings of the Uvuld and Tonsils.

GARGARISMA ÆRUGINIS. (Currie.)

R Oxymellis æruginis f3ss. Mellis rosæ f3ij. Decocti hordei f3vss.

Misce, ft. gargarisma. Idem.

MISTURA CREOSOTI. (M'Donald.)

R Creosoti wx.

Sp. Æth. Sulph. co. f3ij.

Decoct. cinchonæ f3vj.; vel

Tinct. cinch. co. f3vj.

Aquæ ad f3vj.

Misce. The fourth part every six hours. Use—In Chronic Bronchitis, Phthisis, (!) &c.

MIST. CREOSOTI. (Ibid.)

R Creosoti mxij. Pulv. acaciæ 3ij. Aquæ destill. f3vj.

Misce. The fourth part every six hours. Use—In Chronic Dynentery; said also to be serviceable in Dyspepsia.

HAUSTUS CREOSOTI.

R Creosoti mj.

Acidi acet. dilut. mxv. Aquæ destillatæ f3j.

M. ft. haustus. One, every two or three hours. Use—In Chronic Vomiting.

PILUL. SECAL. CORNUT. ET CAMPH. (Robert.)
R. Secal. cornut. pulv. gr. ij.

Camphoræ gr. j.

Ft. pil. One night and morning. Use—In Nocturnal
Pollutions.

ENEMA ACETATIS PLUMBI. (Neubold.)

R Plumbi acetatis gr. x. Aquæ destill. f3x. Acidi acet, dil. f3ij.

Solve, ft. enema. Use—In Strangulated Hernia. One every two hours. Dr. Neubold says, operations would be of very rare occurrence, were this agent more extensively used. He has given from four to six enemata in one case, without any bad results. Dr. Hasserbrone confirms this statement by his own experience.

MIST. IPECACUANHÆ. (Dr. Turelutti.)

R Pulv. ipecacuanhæ gr. xv.—3j. Decoct. tamarindi bullient. Oj.

Misce. A tablespoonful every twenty minutes. Recommended in Uncomplicated Dysentery. The decoction is made by boiling three ounces of tamarinds in a pint of water. The doses of the medicine must be given more or less frequently, so as to keep the patient in a state of permanent nausea, and should be continued for some days after the stools have ceased to contain blood.

MIST. COPAIBE. (The Charity Hospital of Berlin; —Wolffe.)

Bels. copaibæ
Syrupi tolutani
Sp. vini rectif.
Aquæ menth. pip.
Sp. æth. nitr. f3iss.

Misce. Use—In Hamoptysis, dependent on Pulmonary
Tuberculosis. The dose is not mentioned by Dr. Wolffe,

but it is probably the sixth part every three or four hours. The mixture must be shaken before it is used, as the balsam separates and floats on the surface.

MISTURA ALUMINIS. (Dr. Andrews.)

R Aluminis gr. xlviij. Syrupi simplicis f\(\frac{7}{3} \) ss. Aquæ ferventis f\(\frac{7}{3} \) vss.

Solve. 3j. contains one grain. Recommended in cases of Bronchitis, Cynanche Trachealis, Hæmoptysis, Pertussis, and in Chronic Affections of the Lungs. In general it does not interfere with the expectoration. For a child three years old, the dose is a teaspoonful three or four times a day; between three and seven, a dessert-spoonful; and to persons who have attained puberty, two tablespoonsful.

MIST. FERRI SESQUICHLOR. (Clay.)

R Tinct. ferri sesquichlor. f3j.

—— opii f3iss.

Inf. lichen. Island.
— gentian. comp.

M. fiat mist. An ounce to be taken every four hours.

USP—In Hæmaturia, dependent on Renal Disease.

MIST. ACIDI GALLICI. (Sampson.)

R Acidi gallici 3j. Inf. aurant. c. f3iv. Aquæ f3ij.

M. ft. mist. The sixth part every six hours. Use—In cases of Albuminous Urine, and Hæmaturia.

PULV. ACIDI GALLICI. (Ibid.)

R Acidi gallici 3j. Pulv. opii puri gr. vj.

Misce bene, fiant pulv. xij. One, three times a day.
Usr—In Chronic Diarrhea and Intestinal Hamorrhage.

MIST. ACIDI GALLICI. (Curling.)

R Acidi gallici gr. xv. Acid. hydrocyan. mvj. Tinct. hyoscyami f3j. Aq. destill. f3iv.

Solve; a third part three times a day. Use—In Homoturia.

SOLUTIO ARGENTI NITRATIS. (Ricord.)

R. Argenti nitratis 3ij. Aquæ destillatæ f3iv.

Solve. Used as an injection in Chronic Catarrh of the Bladder. Having emptied the viscus, Ricord passes a gum-elastic catheter, and then with a glass syringe throws the injection into the bladder; repeating the operation, according to circumstances, every three, four, or six days.

INJECTIO IODINII COMP. (B. B. Cooper.)

R. Tinct. iodinii comp. f3iv. Aquæ destillatæ f3iss.

M. fiat injectio. Use—For the radical cure of Hydrocele, two drachms of the fluid being used at a time. This injection, Mr. Cooper says he has found almost invariably successful.

VEL (Boinet.)

B. Tinct. iodinii f3j. Aquæ destill. f3vij. Iodureti potassii 3j.

Solve. Recommended by M. Boinet as an injection into the cavity of the peritoneum, to be used in cases of ascites dependent on idiopathic affections of that membrane. He says he has used it successfully in eleven cases out of thirteen, no injurious consequences following its use in the remaining two cases, other than the persistance of the ascites.

INJECTIO IODINII. (Bouchacourt.)

B. Tinct. iodinii f3iiss. Iodureti potassii jj. Sp. camphorse f3v. Aquæ rosæ f3x.

Misce, ft. injectio. To be used in Encysted Bronchocele.

VEL (Amenille.)

B. Tinct. iodinii ml. Aquæ destill. f3v.

Misce. Use—În Fistulæ.

LOTIO ARGENTI NITRATIS. (Carpenter, of Pennsylvania.)

R. Argenti nitratis Dj. Aquæ destill. f3j.

Solve. Use—Once or twice daily as a topical application to the throat in Scarlatina. Dr. Brown employed this solution, whether ulceration existed or not.

SOL. ARGENTI NITRAT. (Wagstaffe.)

B. Argent. nitrat. Dj.—3iss. Aquæ destill. f3j.

Solve. To be applied to the Mucous Membrane of the Larynx and Pharynx, when diseased, and also in Membranaceous Croup, &c.; Acute Catarrh of those parts, Tonsillitis, &c.; the application to be repeated every five or six hours, or daily, or every alternate day, in Hooping Cough.

LOTIO RHATANI. (Trousseau.)

R. Rad. rhatani Dv. Aquæ bullient. Oij.

Ft. inf. Use—As a lotion in Superficial Fissure of the Anus: in the more deeply-seated fissure, to be employed as an injection, the liquid, as injected, to be allowed to flow back, so as to wash the fissures. The process to be contined for five minutes at a time.

LOTIO HYDRARG. CHLOR. (Velpeau.)

R Hydrarg. chlor. 3j. Decoct. althese făiv.

M. Tents of lint soaked with this lotion to be placed in the fissures. Use—In Fissures of the Anus—Rhagades.

LOTIO TANNIN. ET GLYCERINÆ. (Bayes.)

R. Tannin. 3j. Glycerinæ f3j.

Solve, et adde Aquæ destillatæ q. s.

Ut fiat lotio. The quantities given in this formula are not furnished by Dr. Bayes. He says, "Pure glycerine dissolves nearly its own weight of tannin, forming a very powerful local astringent application, readily miscible with water. The solution of tannin in glycerine, in one or other of its strengths, is peculiarly applicable to many disorders of the mucous membrane, as it readily combines with mucus, and forms a non-evaporisable coating over the dry membrane; hence it may be applied with benefit to the mucous membrane of the eye and ear, in many of its diseased conditions. It forms also a most convenient application to the vaginal, uterine, urethral, or rectal membrane, when a strong, non-irritant astringent lotion

is desired. In local hemorrhage, when the bleeding surface can easily be reached, it will be of service; it may be applied with a sponge or with a brush. The solution should be kept in the dark, and not prepared long before it is wanted. Glycerine has not the same action on gallic acid.

CARMINATIVES.

Medicines which stimulate the muscular coat of the stomach, and expel flatulence, are called Carminatives. They are all aromatic, and for the most part grateful.

CATHARTICS.

Under this division are comprehended those medicines which stimulate the intestines, and the vessels of their mucous membrane, producing increased evacuation by stool. Some Cathartics are mild in their operation, and others violent; some cause a diminution of the quickness of the

pulse, and a sensation of cold and torpor all over the sanguiferous system; such as saline purges, which are therefore febrifuge. Others have a tonic or astringent quality, as rhubarb, aloes, &c., and are useful in dyspepsia and atonic states of the system. Others, again, are stimulant, and are chiefly useful in bilious cases, and to promote absorption. Others again have a hydragogue quality, and cause a large aqueous discharge, acting also more or less on the kidneys. Some are emeto-cathartics, that is, the purgative action is always accompanied by more or less disturbance and nausea of the stomach, and even by vomiting. The distinctions, however, which different authors have assigned to the substances which promote the evacuation of fæces, and various morbid saburræ from the intestines, are of little practical utility, since purgatives in small doses are laxatives or aperients; while, again, in large doses, they are cathartic or drastic. Several anomalous instances occur, however, in which a large dose does not act so violently as a small one, as in the case of calomel, when given in scruple or half drachm doses.

Table of the principal Cathartics and their doses.

DEMULCENTS, DILUENTS, AND EMOLLIENTS.

Medicines which are used to obviate and prevent the action of acrid and stimulating matters are called Demul-They act not by correcting or changing the acrimony of these, but by involving them in a mild and viscid matter, which prevents them from acting upon the sensible parts of our bodies, or by covering the surface exposed to their action, or by largely diluting the offending matters. Catarrh, diarrhea, dysentery, calculus, and gonorrhea are the diseases in which demulcents are chiefly employed. As they are medicines usually of no great power, they may generally be taken in as great quantities as the stomach will bear.

Table of the principal Demulcents.

Sp. vini rect.

a. 53ij.

Aceti destillati \(\) Aquæ destillatæ f\(\) xvj.

Solve, fiat lotio. Use—For Bruises, with Effusion of Blood.

LOTIO ALCOHOLIS. (Marshall Hall.)

R Alcoholis puri f3j.

Fiat lotio. This lotion, used tepid at first, and afterwards at the temperature of the atmosphere, is to be constantly applied, by means of six folds of linen over and across the upper lobes of the lungs in cases of *Incipient Phthisis*. It is to be used in a small quantity at a time, renewable every five minutes. Its use is to be suspended during the night.

SOLUTIO ARGENTI NITRATIS. (Higginbottom.)

R Argenti nitratis Dj. Aquæ destillatæ f3j.

Solve. Use—As an Application to the Skin in all cases of simple or specific Inflammation, as in Bruises, Ulcers, Erysipelas, or Variola.

DIAPHORETICS AND SUDORIFICS.

Diaphoretics are medicines which, being taken internally, sensibly increase the excretion by the skin. When this is carried so far as to be condensed on the surface, it amounts to sweat, and the medicines that cause so large an excretion are named Sudorifics. Between diaphoretics and sudorifics consequently, there is but little distinction, the operation in

both cases being the same, differing only in degree from the augmentation of the dose, or the employment of auxiliary means.

Table of the princi	pal Diaphoretics,	with their Doses.

Ung. balsam. 3x.

M., ft. ung. To be used in inunction in Anasarca.

EMETICS.

It would be taking a very confined and imperfect view of Emetics, to consider them merely as evacuants of the stomach; for, if traced through the whole of their operations in the various diseases in which they are employed, their influence over the human body appears so manifold and extensive, that they may justly be reckoned amongst the most powerful instruments which the materia medica affords the medical practitioner. Hence, besides their use as evacuants of the stomach, they promote sweating in fevers—favour expectoration in diseases of the lungs—induce absorption in dropsy—and remove obstructions of the viscera, such as jaundice and suppression of the menses.

By means also of their peculiar action on the nervous and vascular systems, Emetics allay spasm in asthma, and check the discharge of blood in hæmorrhages from the lungs and uterus. They have been given with advantage in hæmoptysis, by Dr. Robinson, and by Dr. Stoll, of Vienna, who

found, that in such cases ipecacuanha sometimes acts like a charm, seeming to astringe the bleeding vessels of the lungs sooner and more effectually than any other remedy. In uterine hæmorrhage, small doses only of these medicines, so as to excite nausea, but not vomiting, are found to answer best. But, in both instances, they should be administered with caution, as sometimes they do more harm than good. Dysentery is also among the number of diseases in which ipecacuanha has a peculiarly beneficial effect. It has also been found of service in cases of great exhaustion from excessive hæmorrhage, rousing the vital powers in a most unexpected manner.

Emetics are improper where there is much visceral inflammation (with the exception, perhaps, of that degree of visceral inflammation which takes place in pulmonary consumption), where there are symptoms of congestion of the brain, or determination of blood to the head; in the advanced stages of pregnancy, and in cases of intestinal hernia; persons who have weak and delicate stomachs should be cautious in using them too freely, as Dr. Cullen has remarked, that frequent vomiting renders the stomach less fit to retain what is taken into it, and even weakens its powers of digestion, &c.

Table of the principal Emetics and their Doses.

SELECT FORMULÆ.

CATAPLASMA TABACI FOLIORUM. (Trotter.)

B. Tabaci fol. manipulum cum semisse, Contunde in cataplasma cum Aquæ fontis q. s.

Pt. catapl. Apply to the region of the stomach.

HAUSTUS IPECACUANHÆ. (Brera.)

R Vini ipecacuanhæ f\(\frac{7}{3} \)ss. — f\(\frac{7}{3} \)j.

Antimonii potassio-tart. gr. ij.

Inf. anthemidis tepidi f\(\frac{7}{3} \)iss.

Misce, fiat haustus emeticus.

HAUSTUS EMETICUS. (Heberden.)

R Pulv. ipecacuanhæ gr.xv.—3ss. Antim. potassio-tart. gr. j. Aq. menth. virid. f3xij. Syr. croci f3j.

M., fiat haustus emeticus.

PULVIS EMETICUS. (Gregory.)

R. Pulv. ipecacuanhæ gr.xv. — 3ss. Antim. potassio-tart. gr. j.—gr. ij.

Fist pulvis; when vomiting commences, the patient should drink freely of warm camomile tea. In maniacal cases, a triple proportion, or even more, of the tartarized antimony, will often be required to produce a sufficient effect.

BOLUS EMETICUS. (Gaubius.)

R. Zinci sulph. Dj.

Conf. rosæ caninæ q. s.

Ut fiat bolus. The directions as regards drinking camomile tea apply to this, as to the preceding prescription.

HAUSTUS ZINCI SULPH.

R. Zinci sulph. 3ss.

Aquæ destillatæ f3iss.

Solve, ft. haustus. To be taken immediately.

MISTURA SINAPIS.

R Sinapis pulv. 3j. Aquæ tepidæ f3xij.

Ft. mist. A fourth part to be taken immediately, and repeated every quarter of an hour, until free vomiting ensue. Use—In cases of Poisoning, or when a powerful stimulating emetic is required.

When poisons have been swallowed, or when a sudden and complete evacuation of the stomach is required, a formula like either of these is well adapted for the purpose.

MISTURA EMETICA. (Nicolai.)

R. Ipecacuanhæ pulv. 3iss. Potassæ bitart. 3j.

Aquæ ferventis f3iiiss.

Macera per horam, dein cola et adjice Syrupi f3ss.

Misce. A tablespoonful every half hour, until vomiting ensue. Use—In Dysentery and Bilious Fever.

VEL (Pearson.)

R. Antim. potassio-tart. gr. iij.

Aquæ ferventis f\(\frac{7}{3} \nv j.

Misce. Two tablespoonsful every quarter of an hour, until vomiting be excited.

HAUSTUS ANTIM. POTASSIO-TART.

R Antim. potassio-tart. gr. ij. Aq. fontanæ f3iij. Syr. croci f3i.

Misce. For one dose.

MIST. ANTIM. POTASSIO-TART. (Watson.)

R Antim. p.-tart. gr. j. Aqua ferventis făij.

Solve. A fourth part to be taken every half hour. Use—In Inflammation of the mucous membranes. If the patient become pale and sick, the use of the tartar emetic is to be suspended; to be renewed afterwards if the inflammatory symptoms return. If it cause diarrhœa, a few drops of laudanum should be added to each dose.

HAUSTUS EMETICUS. (Thomson.)

R. Cupri sulph. gr. x.—)j. Aquæ destillatæ f3ij.

Misce, fiat haustus; for one dose.

VEL (Baillie.)

B. Antimonii potassio-tart. gr. j. Vini ipecac. f3iv. Aque pure f3iss.

Fiat haustus.

MISTURA EMETICA. (Duncan.)

B. Pulv. ipecacuanhæ §ss. Antimonii potassio-tart. gr. j. Tinct. scillæ f3j.

Aquæ destillatæ f\(\)\forage viss.

Fiat mistura. Four tablespoonsful to be taken as the first dose, and two afterwards every ten minutes, until vomiting be induced. Use—In Dropsies, before exhibiting Digitalis.

MIST. CUPRI SULPH. (Godefroy.)

B. Cupri sulph. gr. ij. Syr. flor. aurant. f3j.

Aq. menth. vir. f3iv.

Solve. A teaspoonful every ten minutes, until vomiting ensue. Use—In Croup.

PULV. SULPH. CUPRI. (Schwabe.) R. Cupri sulph. gr. iss.—iij.

Pulv. sacch. gr. x.

M., ft. pulv. To be taken every hour. Use—In Croup.

To be continued till the pseudo-membranes are expelled by vomiting. Dr. Schwabe states that he has never seen any injurious results from the exhibition of the copper-salt.

EMMENAGOGUES.

Emmenagogues may be divided into two classes:—
1. Those which act generally upon the system, such as general tonics and stimulants; for example, steel, myrrh, opopanax, and galbanum.—2. Direct stimuli to the uterus, which produce the catamenia from their peculiar action, as the ammoniacal injection, secale cornutum or ergot, electricity, &c. A good deal of mischief has been effected, and some lives endangered or lost, from the supposition that drastic purgatives belong to the second class.

Table of the principal Emmenagogues and their Doses.

ESCHAROTICS.

A term in surgery applied to substances which possess the power of destroying the texture of the various solid parts of the animal body, to which they are directly applied. The

articles of this class may be arranged under two orders.—
1. Eroding escharotics, as blue vitriol, alumen ustum, &c.—
2. Caustic escharotics, as argenti nitras, acidum sulphuricum, acidum nitricum, &c. It is unnecessary to detail the manner of applying them.

Table of the principal Escharotics.

Table of the principal Escharolics.	
Acidum aceticum.	
aromaticum.	
arseniosum.	
hydrochloricum.	
nitricum.

bisulph. }	
110101 010011001	
isce, fiat pulvis. Made into a paste, and used as a	caustic.

Arsenic, thus applied externally, has occasionally caused dangerous symptoms. Some cases are on record where paralysis has followed its use; and others have even terminated fatally. Arsenic, as a caustic, is a favourite remedy for scirrhus and cancer among quacks.

LOTIO IODIN. CAUST. (Thompson.)

R Iodinii Zj. Iodid. potassii Zj.

Sp. vini rectif. f3ij.

Solve. Use—As a counter-irritant lotion on the chest, in Phthisis.

VEL (Fleetwood Churchill.)

R Iodinii 3j.
Potass. iodid. 3ij.
Aquæ destill.
Sp. vini rect.
\$\frac{25}{25}\$ f3ij.

Solve. Use—In congestion and erosion of the cervix uteri.

Applied once or twice a week, the diseased surface being painted with the lotion.

ERRHINES.

The articles belonging to this class may be referred to two orders.—1. Sternutatory Errhines, as nicotiana, hellebore, euphorbium, &c., which are selected for the vigorous, but not suited to patients of a plethoric habit; or those to whom any degree of evacuation would not be hurtful.—2. Evacuating Errhines, as asarum, &c., which are calculated for the phlegmatic and infirm.

Table of the principal Errhines.

Acidum benzoicum. Ruphorbium. Hydrargyri sulphas. Lavendulæ flores. Pulvis asari comp. Tabacum. Veratrum; rarely used.

Misce. A much more powerful errhine than the preceding. These powders to be used as snuff, when a stimulant to the nasal mucous membrane is required. Errhines are but rarely used now, snuff being in such general use that errhines must be very powerful indeed to affect the Schneiderian membranes of professed snuff-takers. They were formerly in considerable request in cases of chronic inflammations of the eyes and ears, in toothache and headache, and also in cases of apoplectic and soporose disease.

EXPECTORANTS

Are those medicines which are employed in various pulmonary disorders, to promote the excretion of mucus, or of pus, from the trachea and bronchial tubes.

Expectorants are very various. Whatever lessens increased action in the vascular system, promotes expectoration in pneumonic inflammation, and the pain is relieved by the unloading of the vessels. But the term is here confined to stimuli having a direct operation on the vessels of the lungs. Expectorants may be divided into stimulant and mucilarinous.

M., ft. pulv. vj. One, every four hours.

[For other EXPECTORANTS, See DEMULCENTS.].

LITHONTRIPTICS, OR ANTILITHICS

Are those medicines which are supposed to possess the power of dissolving calculi in the urinary passages. It is, however, doubted by many, whether there be in reality any such substances. By this term, then, is more expressly meant those medicines which possess the power of removing a predisposition in the body to the formation of calculi. The researches of modern chemists have proved that the calculi most frequently met with consist mostly of lithic or uric acid. With this substance the alcalies are capable of uniting, and forming a soluble compound; and these are, accordingly, almost the only lithontriptics. Electricity and galvanism have been recommended in some cases.

Table of the principal Lithontriptics, and their Doses.

Aqua sodæ efferv	escens	, E.	D.		-	-	fZiv.	ad	f3viij.

Sodæ carbonas		•	-		-		gr. x.	ad	3ss.
	exsid	cata		-		-	gr. v.	ad	gr. xv.

Lime-water, soap, acidulous soda water, caustic alcali, and bitters, are useful in cases of stone. Of the soap, as much may be taken as the stomach will bear, or as much as will prove gently laxative; but of the lime-water few can take more than a pint daily. The acidulous soda water may be taken in large quantities, as it is more agreeable.

SELECT FORMULÆ.

LIQUOR LITHONTRIPTICA. (Hufeland.)

R Calcis hydrochlor. 3j.
Aquæ destillatæ f3jj.

Acid. tart. cryst. gr. v. Syr. papav.

Micæ panis q. s.

Ut ft. pilulæ xx. Two for a dose, twice or thrice a day, if necessary. To be covered with gold leaf.

VEL (Granville, Brera.)

B. Potassæ hydrocyanatis gr. vj. Acid. tart. cryst. gr. iij. Micæ panis q. s.

M., ft. pil. ij. To be taken twice or thrice a day. The pills to be covered with gold leaf. At the temperature of 92° the hydrocyanate is decomposed, tartrate of potash is formed, and the hydrocyanic acid set free. This formula is serviceable therefore, when the peculiar action of the acid is required to be slowly exerted. In chronic disorders, Dr. Granville says, which are likely to be benefited by the protracted use of hydrocyanic acid, these pills will prove not only sufficient for the purpose, but even preferable to other formulæ, although in acute cases the free acid should be used.

TROCHISCI POTASSÆ HYDROCYANATIS. (Granville.)

B. Potassæ hydrocyanatis gr. vj. Acid. tart. cryst. gr. iij. Altheæ gummi* q. s.

B. Nicotine Dj. Sp. tennioris (Zij.

Solve. To be applied by compresses in Tic-douleureux.

LOTIO ACONITI. (Eardes.)

B. Tinct. aconiti f3v. Aq. rose f3v.

M., ft. lotio. Use-As the preceding.

LOTIO ALCOHOLIS. (Marshall Hall.)

B. Alcoholis f3j. Aque f3iij.

M., ft. lotio. To be applied by means of compresses extended over the chest from below the clavicles. It should be used warm at first, and afterwards at the ordinary temperature. It is necessary to renew the application every five minutes, except during sleep. Use—In the early stage of Phthisis.

RUBEFACIENTS & VESICANTS.

Rubefacients are those medicines which, when applied to or vigorously rubbed over the surface of the skin, excite a certain degree of inflammation, which is serviceable in the treatment of disease by the counter-irritation it induces. Vesicants act also as counter-irritants, and sometimes also as antiphlogistics, being applied directly over or close to the seat of the original inflammation, or disease. The quantity of serum withdrawn from the system by means of a blister, and the pus secreted from its surface ere it is healed, have some share in affording relief in internal inflammations, as well as in chronic visceral disease.

Table of the principal Rubefacients and Vesicants.

SELECT FORMULÆ.

LINIM. AMMONIÆ. (Granville.)

B. Liq. ammoniæ fortior. f3ij.

Sp. rorismar. f3iss.

Sp. camphoræ f3ss.

M., fiat linimentum.

LINIM. AMMONIÆ FORTIUS. (Granville.)

B. Liq. ammoniæ fortior. f3iiss.

Sp. rorismar. f3j. Sp. camphoræ f3ss.

M., fiat linimentum. The liquor ammoniæ used in these applications should have a sp. gr. of 872°, 100 parts containing 33 parts of real ammonia. It is more than three times as strong as the liq. ammoniæ of the Pharmacopæia; the spirit of rosemary should be destilled from the fresh plant, and not from the essential oil, and the spirit of camphor should be made with four ounces of pure camphor to two pints of alcohol. In preparing the application, the ammonia and rosemary should be gradually mixed together, when an opalescent and somewhat turbid fluid will be the result, a peculiar ethereal smell being given out. A little alcohol will clear this mixture, and then the camphor may be added. The lotions must be kept in well-stoppered bottles.

LINIM. TEREBINTH. (Stokes.)
B. Ol. terebinth. f3iv.
Acidi acetici f3iiss.
Aquæ rosæ f3iiiss.

Ess. limon. f3iss. Vitellum ovi unius.

M., fiat linimentum. USE—In Frictions in the early stage of Phthisis Pulmonalis. It is supposed to resemble St. John Long's embrocation.

VEL (Bellecaitre.)

B. Ol. terebinth. f3iv. Laudan. Rousseau f3j.

M., ft. linimentum. Usr—In Ague. Two tablespoonsful to be rubbed along the spine, night and morning, about two hours before the fit.

SOLUTIO ARGENTI NITRATIS. (Graves.)

B. Argenti nitratis jij.—3j. Aquæ destillatæ f3j.

Solve. USE—To Cauterize the parts in Follicular Disease of the Larynx. In order to apply it, the tongue must be depressed, and the epiglottis brought into view, by means of a pointed spatula.

UNGUENT. IPECACUANHÆ. (Hannay.)

R. Ipecacuanhæ pulv. 3ij. Olei olivæ f3ij. Adipis 3ss.

M. bene. It is to be used in frictions three or four times a-day. It causes in about thirty-six hours a papular and vesicular eruption, far more manageable than that caused by the tartrate of antimony. USE—In Chronic Hydrencephalus, as a Counter-Irritant.

LINIM. AMMONIÆ. (Gondret.)

B. Liq. ammoniæ fort. f3ij. Olei amygdalæ f3ss. Adipis recentis 3vss.

M., ft. linim. To be kept in a wide-mouthed, well-stoppered glass bottle. Use—As a Counter-Irritant in Amaurosis, rubbed on the forehead or vertex, daily.

EMBROCATIO STIMULANS. (Pearson.)

B. Olei olivæ f\(\frac{7}{3} \) iss. Olei terebinthinæ f\(\frac{7}{3} \) iss. Acidi sulphurici f\(\frac{7}{3} \).

Misce, fiat embrocatio. To be rubbed in on the skin, two or three times a day. Use—As a Counter-Irritant, in cases of Neuralgia, &c.

EMBROCATIO AMMONIÆ.

R Alcoholis f3ij.

Liq. ammoniæ fort. f3iij.

Misce. A counter-irritant. Use—For Spasms and Convulsions.

Vitelli ovis q. s.

Ft. linimentum.

239 STATOGOGUES. (Chomel.) EMPLASTRUM OLEI TIGLII. R. Emplastr. diachvli 3iii. Super igne leni liquefac, et adde Ol. tiglii f3viss. Misce, fiat emplastrum. Used, spread thickly on calico, as an external Rubefacient. (Graves.) LINIM. OLEI TIGLII. B. Ol. tiglii gtt. xx.—gtt. xxx. Linim. camph. c. f3j. M., ft. linim. Use-As a Rubefacient. UNGUENT. OLEI TIGLII. (Caventou.) B. Adipis 3j. Cerse albse 3ij. Ol. tiglii f3iiiss. M., ft. ung. The lard and wax to be melted together, and the croton oil added to the mixture when cooling. Use-As a Rubefacient, and, in a diluted state, as an Epispastic Dressing for Blisters. EMBROCATIO STIMULANS. (Reid.) B. Tinct. opii f3iss. —— canth. f3j. Linim, saponis f3iss.

M., ft. linim. To be rubbed on the spine, chest, and abdomen two or three times a day. Use — In Laryngismus Stridulus. The addition of four grains of extract of belladonna, or f3ss. of tincture of aconite, is recommended in obstinate cases.

SIALOGOGUES

Are those substances which increase the quantity of the salivary secretion. The most powerful among these medicines is mercury indirectly, and pyrethrum directly.

Table of the principal Sialogogues.

SELECT FORMULÆ.

PILULÆ HYDRARG. NITRICO-OXYD. (Hunter.)
B. Hydrarg. nitrico-oxyd. gr. j.

Opii pulv. gr. 1. Olei carvoph, mi.

Fiat pilula. To be taken at bedtime. If, after the space of a week, this pill do not affect the mouth, it may be repeated evening and morning; after the patient has become accustomed to the medicine, if it be found not to induce ptyalism, the dose may be increased to two grains in the evening, and one in the morning. The proportion of opium may also be increased to a grain or more, according to circumstances. This preparation of mercury is now rarely given internally.

PILULÆ HYDRARGYRI CHLOR. (Blane.)

R Hydrarg. chlor. 3j. Conf. rosæ Gall. g. s.

Fiant pilul. xxx. One, twice a day, until ptyalism be somewhat excited. Use—In Venereal Ulcers. The use of these pills should be continued for a week, or even longer, according to their action on the system, after the chancres are healed. The dose above given is suited for robust constitutions. For the generality of venereal patients, it will answer better to give single grain doses. There are some idiosyncrasies to which this mercurial preparation cannot be safely administered.

PILULÆ HYDRARGYRI OXYDI CINEREI.

R Hydrarg. oxyd. cinerei gr. xv. Micæ panis 3j.

Mellis, q. s.

Fiant pilul. xxx. One or two, three times a day.

PILULÆ HYDRARGYRI BICHLORIDI.

R Hydrarg, bichloridi Ammoniæ hydrochlor, Glycyrrh, pulv. Địv. Mellis 3ss.

Aquæ destillatæ q. s.

Fiant pilul. xl. One, three or four times a day. Usm—In Syphilis.

SOLUTIO HYD. BICHLOR. (Van Swielen.)

R Hydrarg, bichlor, gr. ij. Sp. tenuior. f3iv.

Solve. A tablespoonful night and morning, in a cupful of barley-water or sarsaparilla. Use-Idem.

MASTICATORIUM PYRETHRI. (Pearson.)

R Pyrethri rad. cont. } aa 3j. Mastiches

To be divided into two boluses, for mastication, the saliva being expelled. Use-In Odontalgia, and Paralysis of the Tonque.

MASTICATORIUM ZINZIBERIS. (Black.)

R Zinzib. pulv. 3ss. Mastiches 3iss.

To be divided into six pastilles, one to be masticated constantly. Use-In Odontalgia, and Paralusis of the Tongue.

(Fox.) COLLUTORIUM PYRETHRI.

R Pyrethri radicis 5ss. Acidi acetici dil. f3vi. Opii pulv. gr. iij.

Macerate for an hour in a sand-bath, and filter. A tablespoonful of the filtered liquid to be kept in the mouth for some time, and then spat out. Use-In Odontalgia.

(Hunter.) GARGARISMA HYDRARG. BICHLOR.

R Hydrarg, bichlor, gr. iij. Decocti hordei făvi. Syrupi tolutani f3j.

Fiat gargarisma.

PASTILLI PYRETHRI. (Magendie.)

R Rad. pyrethri pulv., vel } && 3j. Mastiches

R

To be made into two pastilles, for mastication. Use—In Odontalgia.

STIMULANTS.

Medicines which possess the property of rousing the energy of the system, and supporting the languid and drooping powers of life, are denominated Stimulanta: they are also termed *Cordials*.

Sacch. purificat. 3i. Misce. A dessertspoonful every four or six hours. Use—In Typhus. (Paris.) MISTURA AROMATICA. R Sinap. sem. cont. Armoracise rad. cont. Aquæ ferventis Oj. Macerate for an hour, and filter. R Colaturæ f3vii. Sp. ammoniæ aromat. f3j. - pimentæ f\3ss. Two tablespoonsful three times a day. Fiat mistura.

Use-In Paralysis.

MISTURA BISULPHURETI CARBONIS.

R Bisulphureti carbonis p. ij.

Sp. vini rect. p. viij.

Misce. Eight drops every two hours. Use-In Rheumatism and Glandular Enlargements.

(Bricheteau.) PILULÆ BRUCINÆ.

R Brucinæ gr. ss.-gr. j., ij., iv., vj., viij.

Micæ panis gr. iv.

M., ft. pilula. Use—In Paralysis. Bricheteau says he has, in some cases, given as much as sixteen grains (eighty centigrammes) at a dose, but he has done so but rarely. Eight grains may be considered a very large dose. and it would be safer to restrict the quantity ordered to even less than half that amount. In the dose of from two to three grains, brucine causes slight jerks and prickings in the paralysed limbs; from four to five grains increase the power of the jerkings, and cause rigidity. Neither headache nor disorder of the mind is induced by brucine.

SOLUTIO ACET. STRYCHNIÆ. (Marshall Hall.)

B. Strychnize acet. gr. j. Acidi acetici mxx.

Aquæ destillatæ f3j.

From ten to fifteen drops three times a day in water, after a meal. Use-In Paraplegia from Nervous Debility.

PILUL. STRYCHNIÆ. (Waters.)

B. Strychniæ puræ gr. j.-gr. il.

Iodureti ferri Extracti conii } aa gr. xxxvj.

M., ft. pil. zij. One, twice a day. Use-In Neuralgia.

(Duclos.) PILUL. NUCIS VOMICÆ.

B. Extr. alcoh. nucis vomices gr. lxxv.

Divide into 100 pills; one to be taken every night for five nights; then two at night and one in the morning for five days; then, for five more days, two night and morning; for five more days three at night, and two in the morning, until four are taken at night, and four in the morning. Use—In Impotence and Spermatorrhaa. The regimen should be tonic.

LINIM. NUCIS VOMICÆ. (Duclos.)

B. Tinct. nucis vomicæ } āā f3j.

—— arnicæ
—— canth. f3ij.

M., fiat linim. To be rubbed freely on the loins and inside the thighs. Use—In Impotence and Spermatorrhea.

MIST. STRYCHNIÆ. (Magendie.)

R Strychniæ gr. j. Acid. acet. fort. gtt. ij. Aquæ destill. f3iss. Syr. simpl. f3ss.

Solve. A coffeespoonful evening and morning. Use—In General or Partial Palsy.

INJ. STRYCHNIÆ. (Lacluyse.)

R Strychniæ gr. vj. Alcoholis q. s., ut ft. solut. Aquæ destill. Oj.

Misce. Two ounces to be injected three or four times a day, the bladder being previously emptied. Use—In Paralysis of the Bladder.

MIST. POTASSÆ CHLOR. (Hunt.)

R. Potassæ chlorat. 3ss.—Dij. Syr. simpl. f3j. Aquæ destill. f3xi.

Solve. A teaspoonful every hour, or oftener. Use—In Cancrum Oris.

VEL (C. Hawkins.)

B. Potass. chloratis 3j. Tinct. cinchonæ c. f3ss. Aguæ destill. f3iss.

Solve. Two teaspoonsful every three or four hours.

Usm—In Phagedenic Ulceration of the Muccus Membranes in Children; the following lotion being also used:

B. Chlor. calcis 3j.

Aques 73xx.

M., ft. lotio.

MIST. OL. JECORIS ASELLI. (Thompson.)

B. Ol. jecoris aselli f\(\)iss.

Creosoti gtt. iv. Pulv. tragacanth. comp. 3ij.

Aquæ anisi fživss.

M., fiat mistura. An ounce to be taken three times a day.

USE—In Phthisical and other cases in which Cod-liver
Oil may be useful, especially Chronic Rheumatism,
Neuralgia, and Sciatica, when associated with Anemia.

Dr. Thompson asserts that the oil is also serviceable
in diabetes. The addition of creosote makes the stomach
more tolerant of the remedy.

OL. AMYGD. PHOSPHOR. (Thompson.)

R. Phosphori gr. j.

liver oil.

Ol. amygd. dulc. Oj.

Solve. Two tablespoonsful twice or thrice a day. Usr—In
the same cases as Cod-liver Oil, Neat's-foot, or Sperm
Oil, but not with the same advantage. The benefit
derived from its use is, at present at least, only temporary. This formula seems to have been prepared
because phosphorus and phosphoric acid in minute
quantities were discovered by chemical analysis in cod-

LINIM. OL. JECORIS ASELLI. (Thompson.)

B. Ol. jecoris aselli f3iij. Sp. ammon. arom. f3j.

Ol. ess. lavend. f3ss.

Pulv. opii gr. v.

Solve. Half to be rubbed in night and morning. Use—In cases of Phthisis, when the stomach is intolerant of the oil, or as an auxiliary to the internal administration of that drug. Dr. Thompson has also used the oil per se in such cases, the aromatic spirit of ammonia and the powdered opium being omitted, and apparently with equal benefit.

MIST. OL. JECORIS ASELLI [OLEI MORRHUÆ.] (Percival.)

R. Liquoris potassæ mxij.—mxxxvj. Ol. jecoris aselli f3j.—f3iij. Aq. menth. pip. f3ss.—f3iss.

M., flat mistura. A third part for a dose. Usr-In

Chronic Rheumatism, &c. Cod-liver oil, combined with an alcali, was largely used in the treatment of that disease by Dr. Percival, at the Manchester Infirmary, about seventy-five years since.

Mem.—Cod-liver oil is generally given uncombined with any other drug. The dose usually commences at one or two drachms three times a day, and is gradually raised to an ounce or even two. To effect any real benefit, its use should be persisted in for several months, especially in cases of phthisis. In chronic rheumatism, an alcali, such as the liquor potasse, may be given with it: formulæ for that purpose are subjoined. When the stomach utterly rejects the oil, even the most purified, Dr. Theophilus Thompson says he has used it endermically with advantage, an ounce being rubbed in on the chest night and morning.

MIST. OL. JECORIS ASELLI. (Ranking's Abstract.)

R. Ol. jecoris aselli f3j. Liq. potassæ carb. f3ij. Syr. aurantii f3j. Ol. carvoph. miv.

R. Liq. plumbi diacet. gtt. xij. Extr. thebaic. gr. iij. Creosoti gtt. x.

Adipis 3j.

M., fiat ung. Use—In Ulcerated Chilblains.

LOTIO TERCHLOR. CARBONIS. (Robinson.)

B. Terchlor. carbonis f3j. Aquæ destill. f3viij.

M. To be used as a Lotion in Cancrum Oris.

SOLUTIO PHOSPHORI. (Canstatt.)

Phosphori gr. iv. Sulphurici naphthæ f3j.

Solve. Ten drops every two hours in water. Us-In Senile Hectic.

TINCT. PHOSPHORI. (Ion Kowitz.)

B. Phosphori gr. ij.
Sp. terebinth. f@ij.
Dissolve the phosphorus, and add
Ess. calami mxx.
Æther. sulph. f%iiss.

M. Six drops, gradually raised to twenty, every two hours, on a lump of sugar. Has been used successfully in Paralysis of the Tongue. The preparation should be kept in a closely stoppered black bottle.

EMBROC. PHOSPHORI cum TEREB. (Sasse)

R Ol. olivæ opt. f5xviij.

Rad. anchusæ q. s., ut fiat color lente ruber.

Decocto oleo, adde

Phosphori gr. viij.

Camphoræ } äā 3ss.

Ol. cumin. }

Ol. terebinth. f5j.

Solve, ope calor. aq. fervent., &c., ft. embroc. Use—In Hooping Cough, as a Substitute for Roche's Embrocation; also in Chronic Rheumatism, and in Deafness from a Catarrhal Affection of the Meatus Auditorius Externus.

UNGUENT. PHOSPHORI. (Codex Gallicus.)

R. Phosphori 3j. Adipis 3viss.

M. Put the lard and phosphorus in a large-mouthed glass vessel, stoppered with emery, placing a piece of paper between the stopper and the neck of the bottle, so that any gas that may form may escape; then place the bottle in a marine bath, and let the water boil; afterwards close the bottle completely, and shake it well, until the phosphorus is dissolved, and the ointment quite cold.

PULV. AURI ET SODÆ PERCHLORID. (Chatterly.)

B. Auri et sodæ perchlorid. gr. 1/34.
Iridis Florent. pulv. gr. iv.

M., ft. pulv. To be rubbed on the dorsum of the tongue daily before dinner. Uss—In Strumous Disease, and in Enlarged Mesenteric and other Glands, &c. The perchloride of gold and soda is a stimulant, cholagogue, and alterative. It is apt to decompose.

PILUL. VERATRIÆ. (Magendie.)

R. Veratriæ gr. ss.

Mist. acacise q. s.

Ft. pil. vj. One or more for a dose. Use—In Gout,
Rheumatism, and Asthma.

UNG. VERATRIÆ. (Calvi.)

R Veratrize gr. j.

Adipis Ziss.

M., ft. ung. Use—In Neuralgia. The quantity of veratria should be gradually raised to gr. iss. and gr. ij. M. Sauvan states that if the lard used in preparing the ointment be rancid, the remedy will be more effective.

VEL (Golding Bird.)

B. Veratrize gr. viij.

Adipis 3vj.

M., ft. ung. To be rubbed over the whole spinal region.

USE—In Spinal Irritation.

MIST. STIMULANS. (Form. Hosp. Paris.)

R. Vini rubri f3iv.

Syr. simpl. f3vj.

Tinct. cinnam. f3ij.

M. To be taken by spoonsful during the day. Use—In Atonic Maladies.

MIST. VINI. (Guy's Hospital.)

B. Vini albi, vel ——rubri, vel

— rubri, ver — sp. Gallici f3vj.

Vitell. ovor. ij.

Sacchari 3ss.

Ol. cinnam. gtt. iij.

M. bene. Two tablespoonsful to be taken frequently during the day. Use—To relieve Languor or Fainting, from Debility.

MIST. SECAL. CORNUT. (Boudin.)

R Secal. cornut. gr. xxx. Aquæ f3ij.

M. Use—To be taken in Chronic Diarrhea, with Atony or Palsy of the Rectum, or in Palsy of the Bladder, and in Debility or Palsy of the Lower Extremities. M. Nardo prescribes the ergot also in hysteria, and the same formula may serve to induce its obstetric action. It is also said to possess an homostatic influence.

HAUSTUS MOSCHI. (Graves.)

B. Moschi gr. viij. Sp. æth. sulph. f3ss. — ammon. arom. f3ss.

Mist. camph. f3j.

Misce, ft. haustus. To be taken every three hours. Usu —In the Latter Stages of Fever.

PIL. MOSCHI CO. (Ashwell.)

B. Moschi gr. xl.

Pulv. zinzib. aa gr. vj. valerian.

Camphoræ gr. xij. Conserv. rosæ q. s.

Ft. pil. xij. Two to be taken every three or four hours. Use—Stimulant and Antispasmodic.

MIST. SABINÆ cum JUNIP. (Balyn.)

B. Bacc. junip.

Herb. sabinæ recent.
Rad. calam.

Aquæ fervent. f5xvj.

Infuse for two hours, and strain: a cupful for a dose, three times a day. Use—Said to be successful in the treatment of Gout and Rheumatism. Dr. Chapman (Elem. of Therap.) strongly recommends savine in such cases. The quantity of savine prescribed seems very large.

PILUL INDIG. (Baron Michel.)

R Extr. opii gr. ij.

— valer. — cinchon. } āā gr. xxiv.

Pulv. indig. gr. xvj.

M., ft. pil. xxiv. Two to be taken night and morning; a wineglassful of the infusion of arnics montana being

administered after each dose. Use-In Neuralgia, from Wounds and Injuries.

M., ft. ung. Use—In the Treatment of Burns and Scalds.

The proportion of creosote, in cases of children, may be diminished one fourth, or one half, according to their age, the formula above given being intended for the use of adults only. In very protracted cases, the quantity of creosote used may be increased.

SUDORIFICS. - See DIAPHORETICS.

TONICS.

Under this class are comprehended those remedies which dispose the heart and arteries to more forcible contraction; are adapted to counteract debility, or to give strength and energy to the moving fibres, but which do not stimulate in any remarkable degree. The use of Tonics is very extensive. Perhaps one half of all diseases require them: nearly all the neuroses—many of the pyrexiæ, and as many of the cachexiæ and locales. Tonics belong both to the vegetable and mineral kingdoms.

Ut fiat electuarium. A teaspoonful twice or thrice a day.

MIST. SODII CHLOR. (Piorry; --Herrick, U.S.)

R Sodii chlor. 3vj.—3viij. Mist. acaciæ fžiij. Aquæ fžij.

M. Half to be taken twice a day. Use—In Intermittent Fever. Piorry uses larger doses; two tablespoonsful of common salt once or twice daily. He asserts it not only promptly arrests the paroxyams of the fever, but exerts as beneficial an influence on the spleen as quinine. Dr. Herrick explains its action by its preventing the destruction of the blood-globules. When the fever has been checked, he prescribes as follows, as a tonic and corrective of the secretions of the alimentary canal:—

PULV. SODII CHLOR. cum FERRO. (Herrick.)

R. Sodii chlor. gr. x. Ferri carb. gr. x.

Misce, ft. pulv. To be taken twice or thrice daily.

PILUL. PIPERINÆ COMP. (Hartle.)

R Pil. hydrarg. gr. j. Piperinæ gr. ij. Quinæ disulph. gr. ij. Syrupi q. s.

Ut ft. pil. One to be taken three times a day. Use—Recommended in the treatment of Intermittent Fevers, subsequent to the arrest of the paraxyem. Dr. Hartle (Port of Spain, W. Ind.) says his mode of treating intermittent fevers is, as soon as the sweating stage is established, to give three grains of piperine every hour, until eighteen grains have been taken; on the following day, when the intermission is complete, he gives the same quantity every three hours. This, he says, succeeds in arresting the paraxyem, after which the formula given above is to be used for several days.

MIST. NUCIS VOMICÆ. (Richter.)

Solve. For children from six to twelve years of age, a teaspoonful; for the elder ones, a dessertspoonful six times a day. Usz—In Chorea.

MIST. QUINÆ. (Upshur, Norfolk, U.S.)

B. Quinæ disulph. 3ss. Morph. sulph. gr. ss. Aquæ destill. f3iij.

M., ft. mist. A tablespoonful every hour. Use—In Remittent Fever, with Diarrhæa. Dr. Upshur treats all fevers of miasmatic origin, in all their stages, with quinine in large doses. He tried it in 105 cases of fever, of which 83 were intermittent, and 22 remittent. In 25 cases, thirty grains were given in five hours. In one case of quotidian, fifteen grains were exhibited just as the cold stage was passing off: the fever did not return. Symptoms of quininism occurred in only three cases. The quinine is to be preceded by mild aperients, when the bowels are torpid, and combined with morphia, if diarrhæa be present.

MIST. QUINÆ. (Jewel.)

B. Quinæ disulph. 3ss. Inf. rosæ c. f\(\frac{3}{2} \) viiss.

Acid. sulph. arom. f3j.

Solve, fiat mist. Two tablespoonsful three times a day.

LIQUOR FERRI POTASSIO-CITRATIS.

(Dr. John Todd.)

R. Acid. citric. cryst. 5j3v. Potass. carbonatis 5vij. Ferri sesquioxydi 5j. Sp. ammoniæ arom. q. s. Aquæ destillatæ 5xxiv.

Dissolve the acid and alcali in the water; when the effervescence has entirely ceased, add the steel, and digest for
twenty-four hours (frequently stirring) at a gentle heat:
filter the liquid, and neutralize any excess of acid, by
gradually dropping the aromatic spirit of ammonia into
the solution. The liquid is of a reddish-brown colour, not
precipitated by alcalies, nor altered in colour by the ferrocyanide of potassium or the tincture of galls. The taste
is slightly styptic. One drachm contains five grains of
the dry ferri potassio-citras. It is a valuable form for the
administration of steel.

*Oxide of Silver.—Introduced into England 1840, by Dr. Butler Lane.—Used in Epilepsy, Hysteria, Gastrodynia, Hæmorrhages, Hyper-Secretion, Uterine Irritation, &c. It is benefisial in these morbid states chiefly when they assume an atonic character, and more especially in the female than in the male. It has a peculiar influence over the uterine system, and in those states of nervous irritation which depend thereon, whether spasmodic or neuralgic, it is very beneficial. Oxide of silver has been given successfully for Tomis.

Misce, ft. haust. One, three times a day.

PILUL. IODID. ARSEN. (B. Childs.)

R. Iodid. arsen. gr. ¹/₁₆. Extr. papav. alb. gr. iij.

Misce, fiat pil. One to be taken three times a day. Ordered in a case of Ulcerated Cancer of the Breust, the whole surface of the Ulcer being cauterized with the acid nitrate of mercury at intervals of several days. The following lotion was also used:—

B. Acidi nitrici gtt. ij. Vini opii gtt. xx. Mist. camph. f3j.

Misce. Cicatrization took place, and a cure was apparently effected. The primary action of the iodide of arsenic is that of a tonic, but after ten or twelve days, if its use be persevered in, some pain is experienced, with thirst, a dry state of the throat, slight fever, and sometimes diarrhoea and tenesinus; the skin becomes dry, and the urine increased in quantity. If it be still exhibited, the nervous system is rendered extremely irritable, with insomnia. Its action requires to be closely watched, and its use should cease as soon as soreness of the throat or pain at the epigastrium ensue. The dose is from -th to th of a grain. It is contra-indicated by an irritable or plethoric habit, by inflammatory fever, the hæmorrhagic diathesis, phthisis, or hectic. When given for a length of time, it is apt to accumulate in the system, and symptoms of poisoning may set in, i. e., pain at the epigastrium and in the lower bowels, tremors, and general febrile excitement. In large doses, it is a most virulent poison: applied to a mucous or serous surface, or to a wound or ulcer, it will be absorbed, and exert a deleterious influence on the nervous centres and on the heart, the irritability of which it destroys. —(A. T. Thomson.)

SOLUTIO ARSENICALIS. (Boudin.)

R. Acidi arsenici gr. ij. Aquæ destillatæ Oij.

Solve. An ounce and a half of this solution is exhibited by M. Boudin in intermittent fevers, four or five hours before the paroxysm, preceding its use by an emetic of ipecacuanha and tartarized antimony. He also gives it in similar doses in the treatment of inveterate syphilis, and syphilitic and other cutaneous eruptions. Great caution must be used when prescribing it.

HAUSTUS QUINÆ cum ARSEN. (Boudin.)

 Aquæ destill. f3x.
 Acid. sulph. dil. gtt. xx.
 Solut. arsen. ut supra, f3iiss.

Misce, ft. haust. To be taken about five hours before the expected paroxysm. Use—In Intractable Intermittent Fevers.

MIST. ARSEN. POTASSÆ. (Hogg.)

Misce. One tablespoonful every four hours. Recommended in Diabetes Mellitus, to prevent the elaboration of the saccharine poison in the stomach. The diet must be regulated accordingly. Mr. Hogg describes one case in which the arsenical medication appeared to be exceedingly serviceable. The patient had been for some time passing three gallons of mellitic urine daily, of the specific gravity Before a week had elapsed, the quantity of 1.050. of urine eliminated daily was only three quarts, specific gravity 1.040. The patient gradually improved, and apparently recovered, the urine, after the lapse of a month, showing scarcely a trace of sugar, and being normal in quantity, but the specific gravity was still high. The man was in wretched circumstances, and lived in an underground cellar. He soon after sank from phthisis. the disbetic condition not having recurred.

PRESCRIPTIONS

SPECIALLY ADAPTED FOR CERTAIN DISEASES,

A8

Syphilis, Gonorrhoa, and Gleet; Diseases of the Skin; Diseases of Women, of the Eye, the Ear, and the Teeth; and for Cholera.

SYPHILIS, GONORRHŒA, AND GLEET.

M., ft. pil. xxiv. One, three times a day. Use—In dispersing the Enlargement in Orchitis, after the inflammatory symptoms have subsided.

LINIM. HYDRARG. cum opio. (L. Parker.)

R Cerati simplicis, vel mellis 3j. Olei olivæ f3j. Hydrarg. chlorid. 3ss. Extr. opii 3j.

Solve. A little to be introduced, from time to time, between the glans and prepuce, by means of a camel-hair pencil. Usp—In Balanitis.

LOTIO PLUMBI DIACET. (L. Parker.)

R Plumbi diacet. 3j. Aquæ destill. f3viij.

Solve. To be injected three or four times a day, or more frequently. Usr—In Balanitis.

* In chronic orchitis, benefit has been derived from compressing the swollen testicle by means of strapping. The ordinary adhesive plaster may be used for that purpose, but the emp. ammon. cum hydrarg., or the emp. vigo cum mercurio of the French Pharmacoposis, a formula for which will be found in this section, is more useful. Mr. Parker says the best plaster for strapping the testis is composed of equal proportions of soap, belladonns, and adhesive plasters. The mercurial plaster sometimes irritates the scrotum. In this opinion I fully coincide.

PIL. COLCH. cum OPIO ET CAMPH. (L. Parker.)
R. Extr. acet. colch. gr. j.—gr. iij.

Camphoræ gr. iij.

Pulv. opii gr. ss.

Misce, ft. pil. To be taken three times a day. Use—In Gonorrhood Rheumatism.

MIST. ANTIM. POTASSIO-TART. (Curling.)

R Antim. potassio-tart. gr. j.

Aque destillatse f3iv.

Solve. The fourth part every three or four hours. Use—In Acute Orchitis; serviceable, also, in other instances of Inflammation, with Pyrexia.

UNG. BELLADONNÆ. (Philippe.)

B. Extr. belladonnæ 3ij.

Adipis 3vj.

Misce. 3ss. to be rubbed in night and morning, each friction lasting five minutes. Use—In Ganglionitis, Adenitis, and Epididymitis. In twenty cases of orchitis, M. Philippe says the average duration of treatment was fifteen days: some were cured in five, six, and nine. Several cases were traumatic.*

SYPHILIS.

MIST. ACIDI NITRICI. (Fricke.)

R. Acidi nitrici f3ss.

Syrupi simplicis f\(\mathcal{Z} \)j. Decoct. avenæ f\(\mathcal{Z} \)xij.

Ut ft. pil. 400. One or two, twice or thrice a day, the dose to be gradually increased. Each pill contains about the first of the salt. Use—As the preceding.

VEL (Parent du Chatelet.)

R Hydrarg. bicyanid. gr. v. Opii crud. gr. xij. Micæ panis 3j.

Mellis q. s.

Ut ft. pil. 96. Each pill contains $\frac{1}{16}$ th gr. of the bicyanide, and $\frac{1}{8}$ th gr. of opium. M. Parent prescribes $\frac{1}{16}$ th of the salt at the beginning, gradually raising the dose to $\frac{1}{12}$ th, $\frac{1}{8}$ th, and even to half a grain. He recommends this salt in preference to all other compounds of mercury. Use—In Constitutional Syphilis.

MERCURIAL VAPOUR BATH. (L. Parker.)

The patient is placed on a chair, and covered with an oilcloth lined with flannel, which is supported by a proper framework. Under the chair are placed a copper bath, containing water, and a metal plate, on which are put from one to three drachms of a mercurial salt, and under each a spirit-lamp. The patient is thus exposed to the influence of three agents-heated air, common steam, and the vapour of mercury, which is thus applied to the whole surface of the body in a moist state. After the patient has remained in the bath from five to ten minutes, perspiration generally commences, and by the end of twenty or thirty minutes, when the bath should cease, it is generally excessive. The lamps are then removed, the temperature allowed gradually to sink, and, when the patient has become moderately cool, the coverings are to be removed, and the body rubbed dry; the patient is then suffered to repose for a short time in an arm-chair, drinking the while a cup of warm decoction of guaiacum or sarsa. Mr. Parker uses four different mercurial preparations for the bath—the bisulphuret, the binoxide,

the grey or black oxide, and the iodide, singly er combined, to meet the emergencies of each particular case. The iodide is the most powerful salt of the four. From half a drachm to three or four of either of the three first may be used, while from five grains to half a drachm of the iodide are sufficient; it is better to use it in small quantities, mixed with a larger dose of either of the other preparations. Mr. Parker employs this bath very extensively in the treatment of syphilis.

In most Chronic Diseases of the Skin—Eczema, Impetigo,
Lichen; but chiefly in Scaly Diseases—Lepra, Psoriasis,
dc.*

MIST. ARSENICALIS. (Devergie.)

B. Oxyd. arsen. alb. gr. ij. Potass. bicarb. gr. ij. Aquæ destill. lbj. Alcohol rectif. gtt. x.

Tinct. cocci q. s.

Solve. Twenty minims are equal to one drop of the liquor arsenicalis. Use—Recommended in Squamous Diseases.

B. Liq. potasse arsen. f3j. Aque destillate f5vij. Misce. Forty minims thrice a day.

If the conjunctive or tarsi become inflamed, the dose should be reduced: if possible, the eyelids should continue slightly tender throughout the whole course. The state of the conjunctive should regulate the strength of the dose. The usual effects of the arsenic are, he says, improved appetite, warmer limbs, from improved circulation, increase of strength and spirits, a more regular action of the bowals, and an improved tone of the whole system. The course must be continued in smaller doses for as many months after the wister as the disease had previously existed years.

MIST. ARSEN. ET HYDRARG. HYDRIOD. (Burgess.)

B. Sol. arsen. et hydrarg. hydriod. f3ij. Syr. zinzib. f3ss.

Aque destillate făiiss.

Misce. Two tablespoonsful twice a day. Use—In Scaly
Diseases. Donovan's solution contains 1th gr. of protoxide
of arsenic, 1th gr. of protoxide of mercury, and 1th gr.
of iodine, in the form of hydriodic acid.

MIST. AMMONIÆ. (Cazenave.)

R Ammon, sesquicarb. 3ss. Syrupi diaphoret, făvii.

Solve. From one to three tablespoonsful to be taken in the course of the day. Recommended as a Succedaneum to Arsenical preparations in the Treatment of Lepra and Psoriasis. If diarrhea, lassitude, headache, quick pulse, and rapid alternations of heat and cold follow, the use of the medicine should be suspended.

UNG. IODURETI SULPH. (Biett.)

Misce, ft. ung. Use—In Prurigo and Eczema of the Genital Organs. The ointment to be rubbed into the parts affected twice a day, and the following powder to be dusted freely over them immediately afterwards:—

R. Camphor. in pulv. subtilissimo reduct. 3j.

Pulv. amyli 3iv.

Misce bene.

PULV. SULPHURIS.

R Sulphur precip. 3j. Potassæ bitart. gr. vj. Pulv. rhei Dj.

Misce, divide in pulv. xij. One, three times a day. Use—In Psoriasis.

UNG. HYDRARG. BICHLORIDI.

(Bluecoat-school Pharmacopæia.)

R Hydrarg. bichlorid. gr. v. Adipis 3j.

Misce, ft. ung. Usr-In Tinea Capitis.

UNG. IODURETI SULPHURIS. (Worthington.)

B. Iodureti sulphuris Dj. Cerati cetacei 3vj.

Misce, ft. ung. Use—In Tinea Capitis, and other cutaneous Affections.

ZINCI CHLORURET. (Cazenave.)

R Chloruret. zinci 3j. Farinæ tritici 3j.—3ij. Aquæ puræ q. s. PULV. OXYD. ARSEN.

R Oxyd. arsen. albi gr. x. Sulphuret. hydrarg. Diiss. Pulv. carb. anim. gr. x.

Misce. A sufficient quantity made into a paste, and applied to the diseased surface. Use-In Lupus. External arsenical applications are dangerous, especially if made to an open sore, because absorption may take place, symptoms of poisoning ensue, and death be the result. About ten years since a quack was tried for manslaughter. on the charge of having caused the death of his patient by arsenical poisoning, he having used an arsenical preparation to destroy a supposed cancer of the breast. Although the unfortunate creature evidently died from the action of the arsenic (the presence of which in the sloughing breast was clearly ascertained by Mr. Brett, of the Liverpool School of Medicine, although not found in the internal organs, its absence from which would merely indicate the recency of the application), the quack got off free. Many such unfortunate cases are on record : some are of recent occurrence.

PULV. ZINCI CHLOR. (Liston.)
R Zinci chlorid.
Farinæ pulv.

Misce bene. When required for use, to be mixed with a little water to the consistence of bird-lime, then spread on lint, and applied over the disease, or else applied all over the disease and its edges with a spatula. Use—As a Caustic, in Lupus.

PULV. ARSEN. cum HYDR. CHLOR. (Startin.)

B. Hydrarg. chlor. 3iss.

bisulph. gr. v.

Acidi arseniosi gr. v.

Misce bene, ft. pulv. To be made into a paste with water, and applied thinly over the diseased surface. Use—In Lupus Exedens. The same remarks apply to this as to Pulv. OXYD. ARSEN.

SOLUTIO HYDRARG. in ACID. NITR.

R. Hydrargyri 3j. Acid. nitric. f3ij.

Solve. To be applied thinly over the diseased surface. Usr—In Lupus Exedens.

MIST. CALCIS HYDROCHLORAT.

(Biett and Burgess.)

R Calcis hydrochlorat. 3ij.—źss. Aquæ destillatæ Oi.

Syrupi gentianæ f3viij.

Solve. Dose—One or two spoonsful evening and morning. USE—In Scrofulous Lupus.

PILUL HYDRARG. QUINÆQUE CHLOR.

(Hamilton.)

R Hydrarg. et quinæ proto-chlorid. gr. ss. Opii puri pulv. gr. ½ Conf. q. s.

Ut fiat pil. One to be taken three times a day. Usr—In Tubercular Lupus, Scrofulous Ophthalmia, Strumous Glandular Tumours, Indurations, and Ulcerations.

Morphiæ hydrochlor. Dij. Adipis Ziss.

Misce, ft. ung. Use -In Inunction, night and morning, in painful Tumours of the Breast.

VEL (Ibid.)

R. Potassii iodid. Ziss. Morphiæ iodhydrat. Di.

> Axungiæ Ziiss. Ess. rosæ gtt. v.

Misce, ft. ung. Use—As the preceding; Dj. being used evening and morning in long-continued, gentle frictions.

EMBROCATIO CAMPHORÆ. (Brodie and Pott.)

R. Sp. vini rect. Sp. camphorse } āā fǯiiiss. Liq. plumbi diacetatis f3j.

Used in Encysted Tumour of the Breast. Flannel Misce.

wetted with the embrocation, is to be applied over the whole of the disease, and the wetting renewed seven or eight times in the course of the twenty-four hours. In a short time the part becomes tender; and if the use of the embrocation be continued, it will be blistered. It should then be omitted, and resumed when the part has somewhat recovered. Sir B. C. Brodie mentions several cases of encysted, non-malignant Tumour of the Breast, in treating which this embrocation was very serviceable.

MIST. CASTOREI CO. (Ashwell.)

R. Tinct. castorei f3j. Sp. lavend. co. f3ss. Tinct. camph. co. f3ss.

Misce. Half a teaspoonful to be taken every three or four hours, in a tablespoonful of water. Use—As an Antispasmodic, in Hysterical Attacks, &c.

Misce, ft. mist.

R Potass. bicarb. gr. xlv. Syr. aurantii f3iij. Aquæ destill. f3iij.

Misce, ft. mist. A third part of each mixture to be taken, mixed together, while effervescing, three times a day. Usn—As a Tonic, after Abortion.

MIST. CINCHON. ACID. (Rigby.)

R Conf. rosar. 3j. Acid. sulph. dil. f3j.

Decoct. cinchons f3xij.

Misce, boil and filter. Two tablespoonsful thrice a day.

USE—As a Tonic, after Abortion.

MIST. IODINII. (Delfrayssé.)

R. Iodinii Dj.

Potassii iodureti Dij. Aquæ destill. f3j.

Solve. Six or eight drops to be taken daily in any bland fluid. Recommended to be taken during the last two months of Pregnancy, to arrest the Growth of the Postus, in cases of Distorted Pelvis, as a substitute for Premature Labour.

UNG. BELLADONNÆ. (Mandt.)

B. Extr. belladonnæ gr. xviij.

Axungiæ Ziij.

Pt. ung. Used in difficult and painful Parturition,—a piece, the size of a nut, being introduced into the uterine orifice every half hour.

MIST. SECAL. CORNUT. (Ryan.)

R Secal. cornut. 3j.

Aquæ fervent. f3viij.

Infuse for a quarter of an hour, and strain. A third part every half hour. Use—To retxcite flagging Uterine Action, during Labour, when the Os Uteri is fully dilated, the parts are natural, and the Child's Head on the Perineum.

MIST. SECAL. CORNUT. (Rigby.)
R Secal. cornut. 3j.

Sodæ biborat. 3ss.

Aq. cinnam. f3iv.

Misce. The third part for a dose. Use—To rouse flagging
Labour Pains. The dose to be repeated, if requisite, at
intervals of half an hour, or rather more. Such adjuvants to nature are rarely needed. Dr. Snow Beck
advises a similar formula, the sixth part every four hours,
to be employed after delivery, to secure contraction and
absorption of the enlarged uterus; and thus to prevent,
as far as possible, prolapse or procidentia of that organ.

SUPPOS. ALUMINIS cum ZINCO. (Tanner.)

B. Aluminis 3j. Zinci sulph. 3ss. Adipis q. s.

Ut ft. suppos. To be passed into the vagina. Usu—In Procidentia Uteri.

LINIM. RICINI. (Tyler Smith.)
B. Olei ricini f3j.

Linim. camph. f3j.

Misce, ft. linimentum. Use—As a Liniment to the Breast, to induce or increase the Flow of Milk. The infusion of the leaf of the castor-oil plant has been found by Dr. M'William and Dr. Tyler Smith to be possessed of galactagogue properties, and the latter physician has also ascertained that castor oil is equally efficient. Dr. T. Smith has employed it beneficially in cases of deficiency of milk, of threatened milk abscess, in sore nipples, with retention of milk, and in other contingencies of lactation, when it is of importance to unload the mammary glands, or to stimulate them to permanent activity.

MIST. QUINÆ. (Leudet.)

R Quinæ disulph. gr. xv. Acid. sulph. dil. gtt. xxx. Inf. rosæ c. f3iv.

Misce. A third part three times a day. Said by M. Leudet to act as a Prophylactic of Puerperal Fever, when that disease is epidemic. It should be given at the commencement of labour, continued for three days, the dose then diminished, and discontinued altogether on the sixth day.

ENEMA TEREBINTH. (Guy's Hospital.)

R Ol. terebinth. f3ss.

Ovi unius vitellum.

Rub well together, and add gradually, Decoct. hordei tepid. f3x.

To be given once a day, or more frequently. Uss—As a Purgative Clyster, in cases of Worms, Puerperal Peritonitis, &c.

MIST. CINCHONÆ. (Gall.)

R Extr. cinchonæ 3ss.—3ij. Aq. menth. pip. f3iv.

Tinct. cinnam. f3iv.

Solve. A teaspoonful every two hours. Use—In Passive
Homorrhage, especially for Women at the turn of life.

PULVIS APERIENS. (Tilt.)

R Sulph. præcip. 3j.

Sodæ bicarb. vel

bibor.

Pulv. ipecac. gr. x.—gr. xv.

Misce, fiat pulvis. One scruple or half a drachm to be taken once a day, in milk. Usn—As an Aperient, to be taken when the Catamenia are finally disappearing.

DISEASES OF THE EYE.

COLLYRIUM ACIDI ACETICI. (Guépin.)

R. Acidi acetici f3j. Aquæ destill. f3j.

Misce, fiat collyrium. USE—In cases where Particles of Iron are imbedded in the Cornea or Conjunctiva, in order to oxidize and dissolve them. It is said to have been used with success.

PULV. HYD. cum CRETÂ cum RHEO.

R Hydrarg. cum creta gr. iv. Pulv. rhei gr. vj.

Misce, ft. pulv. To be taken at night, occasionally. Use —In Ophthalmia Tarsi.

PULV. QUINÆ.

R. Quinæ disulph. gr. iss.

Pulv. sacch. gr. v.

Misce, ft. pulv. One to be taken twice a day. Use—In Ophthalmia Tarsi.

COLLYR, HYDRARG, BICHLOR,

B. Hydrarg. bichlor. gr. ij. Sp. vini rect. q. s. Aq. destill. f\(\f{3}\)viij.

Solve. Use—In Ophthalmia Tarsi.

MIST. IODIN.

B. Iodinii gr. ij. Potass. hydriod. gr. vj. Aquæ destill, f%iii.

Solve. The sixth part three times a day. Use—In Ophthalmia Tarsi.

UNG. HYDRARG. BINOXID.

R Hydrarg. binoxid. gr. xij.—gr. xx. Butyri recentis, vel Adipis suillæ 5j.

Misce bene. Use—In Ophthalmia Tarsi.

R Ung. hydrarg. nitrat. 3j. Ung. cetacei 3iij.

Misce bene. Use—In Ophthalmia Tarsi.

UNG. HYDRABG. BINOXIDI CO. (Dupuytren.)

R Zinci sulph. gr. xvj. Hydrarg. binoxidi gr. viij. Adipis prep. 3ij.

Misce bene. Use—In Ophthalmia Tarsi.

LOTIO OXYDI ZINCI. (Macmurdo.)

R Oxydi zinci gr. xxiv. Mist. acaciæ f3j. Aquæ f3vij.

Misce, flat lotio. Usu—In Psorophthalmia, and Crusta Lactea of the Eyelids and Face.

LOTIO ÆTHERIS cum AMMONIÂ. (Seeds.) R Sp. seth. sulph. comp. f7ss.

Sp. ammon. arom. f3j.

Sp. camphore f3j.

Misce, ft. lotio. To be applied externally on the temples, brow, cheeks, &c., and on the inside of the nostrils, two or three times a day. Use—In Chronic Inflammation of the Conjunctiva and Cornea.

UNG. ARGENTI NITRATIS. (Guthrie.)

R Argenti nitratis gr. x.

Adipis 3j.

Liq. plumbi diacet. gtt. xv.

Misce bene, ft. ung. A small quantity to be applied between the eyelids every, or every other day. Usz—In Conjunctivitis, Acute and Chronic Corneitis, Purulent, Egyptian, and Gonorrheal Ophthalmia, &c.*

UNG. ARGENTI NITRATIS. (Mackenzie.)

R Argenti nitratis gr. v. Adipis 3j.

Misce, ft. ung. UsE-As the preceding.

UNG. HYDRARG. BICHLOR. (Guthrie.)

R Hydrarg. bichlor. gr. v. Ung. cetacei 3i.

Liq. plumbi diacet. gtt. xv.

Misce bene. Use—In Conjunctivitis, Acute and Chronic Inflammation of the Cornea, Pustular and Strumous Inflammations, Purulent and Gonorrhaal Ophthalmia, &c.*

SOL ARGENT, NITRAT.

(Royal Westminster Ophthalmic Hosp., Guthrie.)
R Argent. nitrat. gr.iv.—gr.vi.—gr.vii.—gr.xij.

Aquæ destill. f3j.

Solve. To be dropped between the eyelids. Usr—As the preceding.

SOL. CUPRI SULPH.

(Royal Westminster Ophthalmic Hosp., Guthrie.)
R Cupri sulphat. gr. vj.

K Gupri suipnat. gr. vj Aquæ destillat. f%ij.

Solve. Use—As the preceding.

 The salt must be reduced to an impalpable powder, and mixed carefully with the lard before the Liq. plumbi discetatis be added.

COLLYR. SODII CHLORIDI. (Tavignot.)

R Sodii chloridi 3j.—3iij.

Aquæ rosæ Zj.

Solve. USE—As a Collyrium, in Ophthalmia and Ulceration of the Cornea.

UNG. SODII CHLORIDI. (Tavignot.)

R Sodii chloridi 3j.—3iv.

Adipis puri Zj.

Misce bene. USE—In Inflammation of the Conjunctiva and Cornea, and in Ulceration of the latter Membrane.

COLLYRIUM LAPID. DIVINI. (Codex Gallicus.)

R Cupri sulph. cryst. Potass. nitrat. Alumin. pulv. Camphoræ Zj.

Powder the salts, and melt them in a crucible; add the powdered camphor, and run them out on an oiled stone; keep the lapis divinus in a well-stoppered bottle.

R Lapid. divini 3j.

Aquæ lbij.
Solve et filtra. Use—As a Local Stimulant.

COLLYRIUM ACIDI HYDROCYANICI.

(C. G. Guthrie and Solomon.)

B. Acidi hydrocyanici (D. Scheelii) f3j.
Aquæ destillatæ f3iss.—f3ij.—f3ij.

Misce et agita. A few drops to be applied to the eye in cases of Strumous and Catarrhal Ophthalmia, twice a day, in addition to the requisite constitutional treatment. Its effects are soothing and sedative. Hydrocyanic acid, of Scheele's strength, used pure, or but slightly diluted, causes in the healthy eye a feeling of heat and temporary congestion of the conjunctiva,—acts as a stimulant, in fact.

SOL. ZINCI SULPH. (R. West. Ophth. Hosp.)

R. Zinci sulphat. gr. iv. Vini opii f3j.

Aquæ destill. f3iv.

Solve, ft. collyr. Use—In Conjunctivitie.

COLLYR. HYDRARG. BICHLOR. (Mackenzie.)

B. Hydrarg. biehlor. gr. j. Ammon. hydrochlor. gr. ij. Aquæ destill. f\(\frac{3}{2}\)viij.

Vini opii f3ij. Solve, ft. collyr. Use—In Catarrhal Ophthalmia.

COLLYR. CUPRI CUM BELLADONNÂ.

R Cupri sulph. gr. iij. Extr. belladonnæ gr. ij. Aquæ destill. f3iv.

Solve. Use—In Catarrhal and Strumous Ophthalmia.

UNG. CREOSOTI. (Tanesville.)

B. Creosoti gtt. x.—gtt. xx. Adipis, vel

Ung. hydrarg. 3j.

Misce. Use—In Scrofulous Ophthalmia, and Opacity of the Cornea, Inflammation of the Meibomian Glands, Vascular Albugo, the result of the Granular Conjunctiva, and in Purulent Ophthalmia. Dr. Tanesville has also employed the ointment with advantage in several external scrofulous affections, ulceration of the skin, &c. The lard is to be substituted for the mercurial ointment in those cases where the latter cannot be borne by the constitution.

MIST. CONICINE. (Fronmueller.)

R Conicinæ gtt. iij. Alcoholis f3j.

Aq. destill. f\(\frac{7}{3} \)iss. (isce. Fifteen drops three times a day, in water. Usr—In Strumous Ophthalmia.

MIST. SULPH. BEBEERINÆ. (Williams.)
R Bebeerinæ sulph. gr. iv.

Aquæ destill. f3ij.

Solve. Half night and morning. Use—In Strumous Ophthalmia. Dr. Williams considers the bebeerine preferable to quinine. It is believed to be the basis of a patent remedy called Warburg's fever drops.

COLLYBIUM OPIATUM. (Codex Gallicus.)

R Extr. opii gr. iv. Aquæ rosarum f\(\frac{3}{2} iv.

Solve. Usu-In Catarrhal and Scrofulous Ophthalmia.

COLLYRIUM TANNIN. (Desmarres.)

R Tannin. pur. 9j.

Aquæ lauro-cerasi destill. f3v.

Aquæ destill. f3iv.3ij.

Solve. Use—In the Second Stage of Catarrhal Conjunctivitis.

MIST. FERRI IODURETI.

R Ferri iodureti gr. iij. Aquæ destill. f3ij.

Tinct. aurantii f5j.

Solve. The third part three times a day. Usp—In Strumous Ophthalmia.

COLLYR. IODINII.

B. Iodinii gr. ij.—gr. iv. Potassæ hydriod. gr. iv.—gr. viij. Aquæ destill. Oj.

Solve, ft. collyr. Use—In Strumous Ophthalmia.

COLLYRIUM CAMPHORATUM OF CONRADI.

R Hydrarg. bichloridi gr. 1-gr. j.

Camphoræ gr. j.—gr. ij.

Alcoholis q. s. pro solutione, adde Aque destillatæ f3ij.

MIST. COLCHICI. (Guthrie.)

R Vini rad. colch. f3iij.

Sodæ sesquicarb. 3ij.

Syr. aurant. f3ss. Mist. camphoræ ad f3vj.

Solve. A fourth part to be taken every four or six hours.

Usp.—In Acute Rheumatic Ophthalmia.

PIL. ACET. COLCH. cum OPIO.

R Extr. acet. colch. gr. ss.—gr. j. Pulv. opii gr. 1—gr. 1.

Conf. rosse q. s.

Misce, ft. pil. One, three times a day. Use—In Rheumatic Ophthalmia.

GUTTÆ AMMON. (Graefe.)

R Liq. ammon. gtt. x.

Ol. nucis jugland. f3ss.

Misce. To be drapped between the eyelids. Use—In Albugo and Leucoma.

UNG. HYDRARG. BINOXID. (Beer.)

B. Hydrarg. binoxid. gr. xv. Butyris recent. Zij.

Tutise gr. vj.

Misce, ft. ung. A little to be smeared on the edges of the eyelids, night and morning. Use—As the preceding.

PULV. OXYDI ZINCI. (Recamier.)

B. Oxidi zinci Pulv. sacch.

Misce bene. A little to be blown between the eyes and eyelids. Use—As the preceding.

COLLYRIUM BELLADONNÆ. (Ammon.)

B. Extracti belladonnæ gr. vj. Solut. chlorinæ, gtt. x.

Aquæ destill. f3v.

Misce, ft. collyrium. Use—In the Purulent Ophthalmia of newly-born Infants.

MIST. MAGN. SULPH. CUM ANTIM. P. TART.

R Magnes, sulph. 3j.
Antim. potassio-tart. gr. ij.
Aquæ ferventis f3viij.

Solve. Two tablespoonsful every hour or half-hour, until nausea and catharsis be induced. Use—In Gonorrhead Ophthalmia, and in many other Inflammatory Affections, with high action.

COLLYR. ZINCI VALER. (Fario.)

B. Zinci valer. gr. ij.—gr. iij. Aq. destill. f3ij.

Solve. USE—În Ophthalmia Blenorrhagica, Ulcerations and Leucomata of the Cornea, Chronic Keratitis, &c.

PIL. HYD. CHLOR. cum OPIO.

R Hydr. chlorid. gr. xij. Pulv. opii gr. iij. Conf. rosæ q. s.

Ut ft. pil. vj. One, four or six times a day, until salivation ensue, then three or four times a day. Use—In Iritis, Idiopathic, Traumatic, or Syphilitic; in Choroiditis, Retinitis, &c. PIL. HYD. cum COLCH. et OPIO.

R Hydrarg. chlorid. gr. xij. Extr. colchici gr. vj.

--- hyoscyami gr. vj. Pulv. opii gr. ij.

Misce, ft. pil. vj. One, three times a day. Use-In Rheumatic Iritis, or in Inflammation of the Choroid or Retina.

PIL. HYD. cum ACET. COLCH. ET OPIO.

R Hydrarg, chlor, gr. xij.

Extr. acet. colch. gr. iii.

Extr. hyoscyami gr. xij.

Pulv. opii gr. ij.

Misce, ft. pil. vj. One, twice or thrice daily. Use—In Rheumatic or Arthritic Iritis, Choroiditis, Retinitis, &c.

PIL. ACET. COLCH. cum OPIO.

B. Extr. acet. colch. Sods exsiccatee

Extr. hyoscyami gr. xij. Pulv. opii gr. ij.—gr. iij.

Misce, ft. pil. vj. One, twice or thrice a day. Use-In Arthritic Iritis.

MIST. COLCHICI.

R. Vini sem. colch. f3iss. Potassæ sulph. 3j.

Syr. croci f3iij. Mist. camph. f3iiiss.

Solve. A third part three times a day. Use-In Arthritic Iritis.

UNG. HYDRARG. cum BELLADONNÂ.

R Ung. hydrarg. fort. 3ij. Pulv. opii 9ss.

Extr. belladonnæ gr. xv.

A little to be rubbed on the temple at Misce, ft. ung. night. Use—In Arthritic Iritis, to dilate the pupil.

PIL. HYDR. CHLOR. cum QUINÂ.

R Hydrarg. chlor. gr. vj.—gr. xij. Quinæ disulph. gr. xij.

Pulv. opii gr. iij.—gr. vj.

Conf. q. s. Misce, ft. pil. vj. One, twice or thrice daily. Use-In Strumous Iritis, also in Amaurosis, but, in the latter case, not pushed so far as to cause Ptyalism.

MIST. TEREBINTH. (Carmichael.)

R Ol. terebinth. rect. f3j.

Vitellum ovi unius,

Tere simul, et adde gradatim Emuls. amygd. f3iv.

Syr. aurant. f3iv.

Tinct. lavand. co. f3ij. Ol. cinnam. miij.

Misco. Two tablespoonsful twice or thrice a day. Use—
In cases of Iritis, where Mercury has failed, or where,
from Idiosyncrasy, it cannot be given to any extent.

HAUSTUS SEDATIVUS.

B. Liq. opii sedativ. mxxx. Syr. rhœados f3j.

Mist. camph. f3iss.

Misco, ft. haust. Use—As a Sedative, in Supra-frontal Pain in Iritis, Rheumatic and Gonorrhead Ophthalmia, and in other Ophthalmic Maladies.

SOL BELLADONNÆ.

B. Extr. belladonnæ þj. Aquæ destill. f3j.

Solve. To be dropped between the eyelids. Use—To prevent Adhesions between the Iris and the Capsule of the Crystalline Lens in Iritis, by dilating the pupil.

SOLUTIO ATROPINÆ. (W. W. Cooper.)

B. Atropinse gr. ij. Sp. vin. rect. f3j.—Solve:—

Aques destill. f3vij.

Misce. Use—As a substitute for Belladonna, to dilate the
Pupil, prior to the operation for Cataract, &c.

UNG. CAMPH. cum atropinâ. (Cunier.)

R. Camphore gr. iv.—gr. viij.
Atropinse nitrat. gr. j.
Alcoholis q. s.; pro solutione:—
Cerati Ziss.

Misce, ft. ung. A piece, the size of a bean, to be rubbed on the forehead and brows in the Neuralgia accompanying Iritis and Glaucoma, and occasionally consequent on the operation for Cataract.

SMUCKER'S PILLS.

R. Sagapeni
Galbani
Sapon. Venet.
Pulv. rhei Jiss.
Antim. potassio-tart. gr. xvi.

Succ. glycyrrh. 3i.

Misce. To be made into pills weighing one grain each; fifteen to be taken evening and morning for a month or six weeks. Use—In Amaurosis.

PULV. STERNUTATORIUS. (Ware.)

R. Hydrarg. sulph. gr. j. Pulv. glycyrrh. Dj.

Misce bene. A fourth part to be used as snuff twice or thrice a day. Use—In Amaurosis.

UNG. STRYCHNLE.

R. Strychniæ gr. 4.—gr. j. Ung. cetacei 3ss.

Misce, ft. ung. To dress a blister on the temple with, or to rub in on that part. Use—In Amaurosis.

COLLYR. STRYCHNIÆ.

R Strychniæ gr. j.

Acid. acet. dil. f3j. Aquæ rosar. f3jj.

Solve. As a collyrium. Use-In Amaurosis.

MIST. ANTIM. POTASSIO-TART. (Scarpa.)

B. Antim. potassio-tart. gr. iij. Aquæ destill. f\(\f{X} \)iv.

Solve. Two tablespoonsful to be repeated every half hour, until nausea be induced. Use—In Amaurosis.

(Pommade de Gondret.) (Codex Gallicus.)

R Ammonise liquoris f3ij. Sevi ovis 3j.

Adipis Fj.

Melt the lard and suet in a wide-mouthed bottle; add the ammonia, stopper the bottle, and shake them together. Plunge the bottle into cold water, shaking it, while its contents cool. Use—To rub on the temples as a Counter-Irritant in Amaurosis.

DISEASES OF THE EAR.

LOTIO ARGENT. NITRAT. (Harvey.)

R Argenti nitrat. Dij. Aquæ destill. f3i.

Solve. To be painted, with a camel-hair brush, over all the inflamed parts. Use—In Chronic Erysipelas of the Auricle, with thickening of the Integument of the Mucous Membrane of the Meatus. This application rarely requires to be repeated more than twice.

UNG. HYD. CHLOR. (Harvey.)

B. Hydrarg. chlor. Div. Adipis 3j.

Misce, ft. ung. Use—In Chronic Erysipelas of the Auricle and Meatus Externus.

INJ. ACET. ZINCI. (Harvey.)

R Zinci sulphat. Plumbi acet.

Ol. creosoti gtt. ij.

Aquæ destillatæ Öij.

Solve, ft. inj. To be used, tepid, two or three times a day, in Otorrhaa.

LOTIO NIGR. cum ZINCO. (Harvey.)

B. Lotio nigr. f3vij.

Zinci sulph. gr. vj.

Solve, ft. inj. To be used as the preceding.

INJ. TANNIN. (Harvey.)

R Tannin. Dj.

Aque destillate făviij.

Solve. To be used as the preceding, in simple Otorrhæa, or when complicated with Fungoid Excrescences.

LOTIO ARGENTI NITRATIS. (Earle, Pilcher, and . Dufton.)

R Argenti nitratis gr. ij.—gr. xx. Aquæ destillatæ f3j.

Solve. Use—În Otorrhea, subsequent to Chronic Inflammation, and also in Aphthous, or Herpetic Ulcerations of the external Auditory Passage. The sulphates of zinc and copper are occasionally used in the treatment of

otorrhoea, but Mr. Dufton strongly recommends the nitrate of silver, as preferable to either of those salts. The meatus should be well syringed, previous to using any injection, so as to remove as much inspissated matter as possible.

SOLUTIO ACETATIS PLUMBI. (Kramer.)

R Acet. plumbi gr. j.—gr. x. Aquæ destillatæ f3j.

Solve. To be dropped into the meatus, twice or thrice a day, the lotion being used either in the cold or tepid state. Use—In Otorrhea, with Disease of the Bones, with or without Perforation of the Membrane. Under its use, Kramer says, the ammoniacal edour of the discharge speedily disappears. He also advises it of the greatest strength, gr. x. ad f3j., in chronic inflammation of the membrana tympani.

LOTIO IODINII COMP. (Harvey.)

R Tinct. iodinii comp. f3ss. Acid. acet. fort. f3j.

Aquæ destillatæ f\(\frac{7}{3}\text{xij.}

Misce, ft. lotio. To be injected into the meatus, warm, and with care, two or three times a day. Use—In Strumous and Gouty Otorrhea.

INJECTIO ASTRINGENS. (Pilcher.)

B. Argenti nitratis, vel
Plumbi acetatis, vel
Zinci sulphatis
Aquæ destillatæ f3i.

Solve. To be injected into the external auditory meatus two or three times a day. Use—In Chronic Inflammation of the Dermal Membrane, with inordinate secretion,—the Mucous or Catarrhal Otorrhaa of Itard and Andral.

UNG. HYDRARG. NITR. DIL. (Harvey.)

B. Ung. hydrarg. nit. ol. amygdal.

Misce. To be applied at night in the meatus. Usz—In the Chronic Inflammation of the Passage in Children, after the cessation of Otorrhaa.

VEL (Dufton.)

R. Ung. hydrarg. nit. 3j. —— cetacei 3ij.

Misce, ft. ung. Use—In Chronic Inflammation of the external Auditory Canal. To be applied twice a day to the diseased parts, by means of a camel-hair pencil, constitutional measures being used at the same time, according to the specialties of the case.

VEL (Earle.)

B. Ung. hydrarg. nitrat. 3iv. Cerati cetacei 3iij.

Ol. olivæ f3j.

Misce bene. A little to be introduced with a camel-hair brush into the meatus, night and morning. Use—To stimulate the Ceruminous Glands of the Meatus Auditorius Externus, in Chronic Erythematic Inflammation.

PULV. ALUMIN. EXSICC. (Pilcher.)

B. Alumin. exsicc. pulv. 3j.

A small quantity to be blown into the external auditory passage occasionally or daily. Use—In cases of Otorrhoa, with Fungoid Growth. The solution of nitrate of silver, or a few drops of the muriate of barytes applied with the aid of a probe two or three times a week, have also been serviceable in similar cases.

GUTTÆ BALS. PERUV. (Birkett.)

B. Bals. Peruv. f3j. Fellis Bovini 3iij.

Misce bene. To be dropped into the meatus auditorius externus daily, after syringing with a solution of mild soap. Usx—In cases of Fatid Discharge from the Meatus.

PIL. HYDR. CHLOR. cum OPIO.

(Pilcher and Harvey.)

R. Hydrarg. chlor. gr. j.—gr. iij. Pulv. opii gr. ½. Conf. à. s.

Pt. pil. One every two, three, or four hours, continued to ptyalism. Use—In Acute Otitis Media and Interna, preceded by Bleeding, Leeching, Blistering, and active Catharsis; and also in Syphilitic Affections of the Ear.

PIL. ACET. COLCHICI. (Harvey.)

B. Extr. acet. colchici Dj. Hydrarg. chlor. gr. x.

Extr. aloes aquos. gr. x.

Misce, ft. pil. xx. Two to be taken with each dose of the following mixture:—

MIST. GUAIACI cum HYDR. POTASS. (Harvey.)

B. Potassæ hydriod. Dij. Mist. guaiaci comp. f\(\f{\f{z}}\)viij.

Misce, ft. mist. A tablespoonful twice or thrice a day.

USE—In Rheumatic and Arthritic Affections of the
Head and Ear.

UNG. ACET. COLCHICI. (Harvey.)

B. Ung. cetacei comp. 3ss. Extr. acet. colchici 3ss. Ol. crotonis tiglii 9j.

Misce, ft. ung. Use—As a Counter-irritant in Rheumatic and Arthritic Affections of the Ear and vicinal parts.

UNG. HYDRARG. cum ANTIM. P. TART. (Harvey.)

B. Ung cetacei comp. 3iij. Antim. potassio-tart.

Antim. potassio-tart. } aa Dj.

Misce, ft. ung. Use—A's a Counter-irritant in Diseases of the Ear.

MIST. GUAIACI CUM FERRO. (Harvey.)

MIST. SALIN. (Stevens.)

R. Sodii chlor. Sodæ phosph. Potass. nitrat.

Potassii chlor. 3ss. Aquæ destill. Oj.

Solve, ft. mist. A wineglassful occasionally. Use—In Cholera, Low Fevers, &c.

PULV. SALINUS. (Ibid.)

B. Sodii chlorid. Dj. Sodæ bicarb. 3ss.

Potass. chlorat. gr. vij.

Misce, ft. pulvis. One powder every, or every two hours. Use—In Cholera; has been found very serviceable by many medical men in the treatment of that pestilence.

MIST. SALIN. (Bouillaud and Oulmont.)

B. Sodii chlor. Ziij. Mist. acaciæ fZiij. Aquæ fZiij.

Solve. To be taken every quarter of an hour by spoonsful, two or three enemata being exhibited during the day, each containing about five drachms of the salt. Use—In Cholera.

MIST. MAGN. SULPH. cum ANT. P. TART. (Jephson.)

B. Magn. sulph. 3j. Antim. potassio-tart. gr. ij. Aquæ destill. f3viij.

Solve. One ounce every half hour. Use—In Cholera.

The vomiting and purging often ceased, it is said, after the third or fourth dose.

MIST. ANTIM. P. TART. (Billing.)

R Antim. pot. tart. gr. ij. Magnes. sulphat. 3ss. Aquæ destill. Oss.

Solve. A tablespoonful every half hour. Use—In Cholera, which Dr. Billing regards as the cold stage of a fever. The dose above given is for an adult. For a child two years old, a teaspoonful is the dose, to be increased proportionately for the intermediate years.

MIST. STIMULANS. (Cruveilhier.)

R. Ætheris sulph. f3v.
Tinct. opii f3j.
Ammon. carb. 3j.

Aq. menth. pip. f3viij.

Misce, ft. mist. A spoonful every half hour. Usr—In

Cholera.

PULV. BISMUTHI NITRAT. (Monneret.)

R Bismuthi nitrat. 3j.—3ij.—3iv.

Rt. pulvis. M. Monneret prescribes the nitrate of bismuth in gradually increasing doses, from two to twelve drachms daily, in the Simple Diarrhea following Lactation; in Cholerine; Gastralgia; in Vomiting from Gastric Neurosis, or from Pregnancy or Dysmenorrhæu, &c. It is best given in powder, mixed with a spoonful of broth or gruel; and is, he says, quite innocuous.

ENEMA BISMUTHI. (Lévy.)

R Bismuthi nitrat. Əj.—Əij.—Əiv.
Mist. acaciæ f3j.

Aquæ f3vj.

Misce, ft. enema. To be exhibited every hour. Usr—In

Cholera, to check the vomiting.

PULV. IPECAC. (Greenwood.)

R Pulv. ipecac. gr. xxv.

Ft. pulv. To be exhibited as an emetic—In the commencement of Cholera.

MIST. OL. CAJEPUTI. (Macleod.) R. Ol. cajeputi gtt. xx.

Mist. acaciæ f3ij.
Ag. cinnamomi f3iss.

Misce, ft. haust. To be taken every hour. Use—In Cholera.

MIST. GUACO. (Chaniac.)

B. Tinct. mikan. guaco f\(\frac{7}{3} \)ss. Aquæ destill. f\(\frac{7}{3} \)iij.—f\(\frac{7}{3} \)iv.

Misce. A spoonful every quarter of an hour, alternated with a similar dose of the decoction of guaco. Use—In Cholera. The guaco (Mikania Guaco of Humboldt and Bompland) has a great reputation in South America as a remedy against the bites of venomous reptiles. It has a powerful diaphoretic action. The decoction is prepared by slowly boiling Jiiss. of the stems and Jj. of the leaves of the plant in a pint and a half of water to a pint.

MIST. OL. TIGLII. (M'Gregor.)

B. Ol. tiglii gtt. v.

Tinct. hyoscyami f3j. Pulv. opii gr. v.

Aquæ menth. pip. f3j.

Misce, ft. haust. To be taken immediately. Use—In

Cholera. If spasms continue, and no free vomiting, the following pills are to be administered until it arise, when the skin becomes warm and the other symptoms improve:—

PIL. OL. TIGIMI cum OPIO. (M'Gregor.)

R. Pulv. opii gr. iij. Ol. tiglii gtt. v.

Misce, ft. pil. Nine grains of opium and fifteen drops of croton oil will produce the best effects; but in one case Dr. M'Gregor gave eighteen grains of opium and twenty-seven drops of the oil before the disease yielded. To prevent a relapse, he advises quinine.

MIST. ACIDI SULPHURICI. (Buxton.)

B. Acid. sulph. dil. f3iiss. Tinct. cardam. comp. f3ij. Aquæ destill. f3vss.

Misce, fiat mistura. Two tablespoonsful after every loose stool, or every four hours. Use—In Passive or Choleraic Diarrhaa. In cases of collapse in cholera, with a scarcely perceptible pulse, cold clammy sweats, and a constant purging, &c., Mr. Buxton gives three tablespoonsful every quarter of an hour, till the warmth returns, the purging is arrested, and the pulse becomes stronger, when smaller doses are given, and at longer intervals. Dr. Austin gives hyd. chlor. gr. v. on the second night, and a black draught the next morning, to restore the system to a proper tone.

MIST. ACID. SULPH. (Sheppard.)

B. Sacch, alb. Jiv.
 Acid. sulph. dil. fJij.
 Tinct. cardam. comp. fJiv.
 Aquæ menth. pip. fJvj.

Solve. A fourth part to be taken every four hours. Use—In Simple and Choleraic Diarrhæa, and in English Cholera. Mr. Sheppard says it is more efficacious than alcalies, opium, and astringents, and much more rapid in its action. He generally gives cold, or even iced water at the same time, or previously to employing the acid. Of course the remedy is not suited for cases of inflammatory diarrhæa.

MISTURA CREOSOTI. (Richardson)

Creosoti gtt. vj.
 Syr. tolut. f3iij.
 Tinct. cardam. c. f3iss.
 Aquæ anethi f3iiiss.

Misce, fiat mistura. A third part to be taken every two hours, in Passive and Choleraic Diarrhea. If sickness be induced, one or two drops of hydrocyanic acid may be added. If there be much debility, sulphuric ether, or the decoction of bark may be used in combination with the creosote. When a dry, white, or filmy state of the tongue is produced, with other signs of fever, the creosote should be suspended, or altogether abandoned. The dose of creosote for a child under two years of age is from athematically the data of the data

LINIM. AMMONIÆ. (Evenius, of Moscow.)

R. Linim. ammon. comp. f3ij.

Tinct. capsici
Liq. ammon. caust.

Tinct. opii f3ij.

Misce, fiat linim. Use—In Frictions on the Body and Limbs in Cholera, from ten to fifteen drops of the following mixture being given internally every quarter of an hour:—

(Ibid.)

R. Tinct. valer. seth. f3j.
—— opii f3ss.

Misce.

HAUST. CHLOROFORM. (Brady.)

R Chloroform. gtt. vj. Ol. ricini f3iij. Tinct. opii πxx. Aquæ menth. pip. f3iss.

Misce. ft. haust. Use—In Choleraic Diarrhea.

LINIM. CHLOROFORM. (Brady.)

R. Chloroform. f3ss.

Olei terebinth. f3ij. Linim. saponis comp. f3j.

Misce, ft. linim. To be rubbed freely over the spine, abdomen, and region of the heart.

HAUST. OLEI RICINI. (Johnson.) R. Olei ricini f3ss.

Aq. menth. vir., vel pip. f3iss.

Misce, ft. haust. To be taken every half hour, until the action of the bowels be well established, a mustard poultice being also applied over the region of the stomach. Use—In Choleraic Diarrhae and Cholera. Dr. George Johnson considers the purging in cholera to be mainly an effort of the organism to throw off the virulent principle which is at the root of the disease. The castor-oil treatment in his hands appears to have been very successful. and some other practitioners also report in its favour, but the great mass of practical evidence is against it. In the weekly report furnished by the registrar, there are many cases recorded in which the taking a dose of castor-oil either converted an attack of diarrhoea into cholera. ending fatally, or else induced an attack of the epidemic while the person was, at least apparently, in good health. During the epidemic of 1832, and probably at other periods, some physicians were in the habit of prescribing repeated doses of croton oil, their object being apparently the same as that of Dr. Johnson.

PILUL. ACETATIS PLUMBI. (Graves.)
R Acetatis plumbi Dj.

Pulv. opii gr. j.

Misce, ft. pil. xij. One every half hour. Use—In Asiatic Cholera. The pills to be given every half hour until the rice-water discharges from the stomach and bowels begin to diminish, the interval being then made longer.

PIL. PLUMBI COMP. (Streeter.)

R Plumbi superacet.
Pulv. capsici
— opii

- fontis or fontana. Spring water.

- nivalis. Snow water.

---- tosti panis. Toast and water.

Avellana, ad molem avellanæ. To the size of a filbert.

Bis ind. Bis indies. Twice a day.

B. m. Balneum maris. A water-bath.

Bull. Bulliat. It should boil.

Bulliant. They should boil.

B. v. Balneum vaporis. A vapour-bath.

Calvaria. The skull. Cap. Capiat. Take.

Cap. Capiat. Ta Cerevisia. Beer.

C. m. Cras mane. To-morrow morning.

Capill. abrad. Capillitium abradatur. Let the head be shaved. Coch. ampl. Cochleare amplum. A tablespoonful. About f3ss.

Coch. infant. Cochleare infantis. A child's spoonful.
About f3iss.

Coch. magn. Cochleare magnum. A tablespoonful.

Coch. med. Cochleare mediocre or medium. A dessertspoonful. About f3ij.

Coch. parv. Cochleare parvum. A teaspoonful. About f3j. Corul. Coruleus. Blue.

Col. Colatus. Strained.

Colet. Coletur. It should be strained.

Colat. Colature. Of, or to be strained liquor.

Colent. Colentur. They should be strained.

Cong. Congius. A gallon.

Comp. Compositus. Compound or compounded. Conterantur probe. Let them be well rubbed together.

Cont. med. Continuantur medicamenta. The medicines should be continued.

Contr. Contritus. Ground to a fine powder.

Coq. Coque. Boil.

Coquantur. They should boil.

Coxa. The hip.

Coxeluvium. The hip-bath.

Crast. Crastinus. To-morrow.

C. m. s. Cras mane sumendus. To be taken to-morrow morning.

Cucurbit, cruent. Cucurbitulæ cruentæ. This expression is used when blood is to be drawn by scarification and

Cucurbitulas affigere. To apply cupping-glasses.

Cui. Cuius. Of which.

Cujusl. Cujuslibet. Of any.

Cyath. theæ. Cyatho theæ. In a cup of tea. Cyathus. Cyathus vinosus. A wineglass. Contains about f3iss.

Deaur. pil. Let the pills be gilded.

Deb. spiss. Debita spissitudo. A proper consistence.

Decoct. hordei. Barley-water.

Decub. Decubitus. Of lying down.

De d. in d. De die in diem. From day to day.

Dei. alvi. Dejectiones alvi. Stools.

Det. Detur. It should be given.

Devoret. Let him swallow.

Dieb. alt. Diebus alternis. Every other day.

Dieb. tert. Diebus tertiis. Every third day.

Digitus. A finger.

Digitus pedis. A toe.

Diluculo. Early in the morning.

Dim. Dimidius. One-half.

Dir. prop. Directione propria. With a proper direction.

Dividatur massa. Let the mass be divided.

Donec. alv. bis dej. Donec alvus bis dejiciat. Until two stools have been obtained.

Donec, alv. sol. fuer. Donec alvus soluta fuerit. Until a stool has been obtained.

Donec alvus probe responderit. Donec alvus sit soluta.

Donec alvus commode purgetur. Until the bowels
be well purged or opened.

Donec supervenerit vomitus. Until vomiting ensue, or shall occur.

Durante dolore. During the pain.

Durante dyspnes. Whilst the difficulty of breathing continues.

Durante paroxysmo. During the paroxysm or fit.

Ejusd. Ejusdem. Of the same.

Elect. Electuarium. The electuary.

Emplastrum. Empl. A plaister.

Enem. Enema. A clyster.

Enemata. Clysters.

Ex quovis vehiculo crasso. In any thick vehicle or menstruum.

Ex quovis vehiculo idoneo. In any proper vehicle.

Ext. sup. alut. Extende super alutam. Spread upon leather. Ft. pil. xij. Fac or fiat pilulas duodecim. Make twelve pills. Feb. dur. Febre durante. During the fever.

Fel. Bile.

Fem. intern. Femoribus internis. On the inner part of the thighs.

Fermentum. Yeast.

Ft. h. Fiat haustus. Let a draught be made.

F. s. a. Fiat secundum artem. Make according to art.
F. venæs. Fiat venæsectio. Bleed. Let a vein be opened.
Fiat massa. Let a mass be made.

Fist. arm. Fistula armata. A clyster pipe and bladder fitted for use.

Fl. Fluidus. Liquid: also by measure.

Fonticulus, vel fontinella fiat. Let an issue be established. Fotus. A fomentation.

Gel. quav. Gelatina quavis. In any kind of jelly.

Gelatina ribesiæ. Currant jelly.

Gelatina vituli. Calves' foot jelly.

Genu. The knee.

G. g. g. Gummi guttæ gambogiæ. Gamboge.

Gr. Granum. A grain. Grana. Grains.

Gtt. Gutts. A drop. Guttæ. Drops. Gutt. quibusd. Guttis quibusdam. With a few drops. Guttat. Guttatim. Drop by drop.

Har. pil. sum. iij. Harum pilularum sumantur tres. Three of these pills should be taken.

Hepar. The liver.

Hirudines applicentur, or admoveantur. Let leeches be

applied.

Horis alternis. Every second hour. Horis tertiis. Every third hour. Hor. decub. Hora decubitus. At going to bed. Hor. som. Hora somni. Just before going to sleep, or on retiring to rest. Hor. un. spatio. Horse unius spatio. At the expiration of an hour. Hor. interm. Horis intermedia. At the intermediate hours between what has been ordered at stated times.

Impluvium. The shower-bath.

Ind. Indies. From day to day.

Infundibulum. A funnel.

Infusum carnis bubuli. Beef-tea.

Inguen. The groin.

In impetu effervescentiæ. In the act of effervescence.

Inj. enem. Injiciatur enema. A clyster should be given.

In lagenå bene obturatå. In a well-stoppered flask.

In pulm. In pulmento. In gruel.

In pulv. tere. Rub into a powder. In pulv. subtiliss, tere. vel tritura. Rub to a very fine powder.

Insperge, or inspergatur paullulum. Spread a little, or let a little be spread.

Inter effervescendum. During effervescence.

Inter terendum. During trituration.

Invadente paroxysmo caloris. When the hot stage is coming on.

Jecur. The liver. Jecinoris. Of the liver.

Juglandis instar. The size of a walnut.

Jusculum avenæ, or avenaceum. Gruel.

Jusculum pullinum. Chicken-broth.

Jus vitulinum. Veal-broth.

Lac asinorum. Asses' milk.

Lac caprinum. Goats' milk.

Lat. dol. Lateri dolenti. To the side that is affected.

Lb. Libra. A pound weight, or a wine pint.

Lumbus. The loin. Malleolus. The ancle.

Maneat in lecto. Let him stay in bed.

M. Misce. Mix.

Mensura. By measure.

M. Manipulus. A handful.

Mane pr. Mane primo. Very early in the morning.

Min. Minium. The sixtieth part of a drachm measure.

Mtt. Mitte. Send.

Mistura. A mixture.

Mittatur. There should be sent.

Mitt. sang. ad 3xij. saltem. Mittatur sanguis ad uncias duodecim saltem. Let blood be taken away to twelve ounces at least.

Mod. presc. Modo prescripto. In the manner directed.

Moles. The bulk.

Mor. sol. More solito. In the usual manner.

Multo mane. Early in the morning.

Nucha. The nape of the neck.

N. t. s. n. Ne tradas sine nummo. Do not deliver the medicine, unless paid for it.

N. m. Nux moschata. A nutmeg.

Obturatur vas. Let the vessel be stoppered.

O. Octarius. A pint; twenty ounces.

Ol. lini s. i. Oleum lini sine igne. Cold drawn linseed oil. Omn. hor. Omni hora. Every hour. Omn. bid. Omni biduo. Every two days. Omn. bih. Omn. bihorio. Every two hours. Omn. man. Omni mane. Every morning. Omn. noct. Omni nocte. Every night. Omn. quadr. hor. Omni quadrante horæ. Every quarter of an hour.

O. o. o. Oleum olivæ optimum. Best olive-oil.

By means of. As, Ope penecilli camellini. By means of a camel-hair pencil.

P. Pondere. By weight.

Palma. The palm of the hand.

Part. vic. Partitis vicibus. Partitis dosibus. In divided times or doses, instead of all at once.

Per. op. emet. Peracta operatione emetici. When the operation of the emetic is finished.

P. A. Partes equales. Equal parts or quantities.

Pediluvium. A foot-bath.

Per biduum, per triduum. For two or three days.

Phiala prius bene agitata. The bottle being first well shaken.

Pleno rivo. In a full stream.

Pollux. The thumb.

Poples. The ham.

Post, sing, sed, liq. Post singulas sedes liquidas. After every loose stool.

P. r. n. Pro re nata. According to circumstances; occasionally.

P. rat. set. Pro ratione setatis. According to the age of the patient.

Pug. Pugillus. A pinch between the forefinger and thumb.

Pulv. Pulvis. A powder. Pyxis. Pixids. A pill-box.

Q. p. Quantum placet. As much as you please.

Q. s. Quantum sufficit. As much as may suffice. Quor. Of which.

R. Recipe. Take.

Recidivum. A relapse.

Red. in pulv. Redactus in pulverem. Powdered.

Redig. in pulv. Redigatur in pulverem. It should be reduced to powder.

Reg. umbil. Regio umbilici. The parts about the navel.

Ren. The kidney.

Repet. Repetatur. It should be continued. Repetantur. They should be continued.

Retinaculum. A truss.

Sanguis mittatur, or detrahatur. Let blood be drawn.

S. a. Secundem artem. According to art.

Semicupium. A half-bath, or hip-bath.

Semidr. Semidrachma. Half-a-drachm. Ss. Semisse. A half—as, Drachma cum semisse. A drachm and a-half.

Semih. Semihora. Half-an-hour.

Sesquih. Sesquihora. An hour and a-half.

Sesunc. Sesuncia. Sesquiuncia. An ounce and a-half.

Sesquidrachma. A drachm and a-half.

Setaceum. A seton.

Serum lactis. Whev.

Si n. val. Si non valeat. If it do not answer. Si op. sit. Si opus sit. If necessary.

Si vir. perm. Si vires permittant. If the strength will allow.

Sign. n. pr. Signetur nomine proprio. Write upon it the usual name.

Sing. Singulorum. Of each.

Singultus. Hiccough.

Spina dorsi. Spine of the back, back-bone.

St. Stet. It should stand.

Stent. They should stand.

Sub. fin. coct. Sub finem coctionis. When the boiling is nearly finished.

Sum. tal. Sumat talem. Take one like this.

S. v. Spiritus vini. Ardent spirit of any strength.

S. v. G. Sp. Vini Gallicus. French brandy.

S. v. r. Spiritus vini rectificatus. Spirit of wine.

S. v. t. Spiritus vini tenuior. Proof-spirit, or half alcohol and half water.

Subinde. Now and then.

Summo mane. Early in the morning.

Sypho. A syringe.

Temp. dext. Tempori dextro. To the right temple.

Trit. Tritus. Ground to powder.

Ult. prescr. Ultimo prescrito. The last ordered.

Urgenti flatu. Flatulence being troublesome.

Urgenti tusse. The cough increasing.

V. s. Venæsectio. Bleeding from a vein. Ventriculo jejuno. The stomach being empty.

ventraculo jejuno. The stomach being empty. Vesicatorium applicatur, or admoveatur. Let a blister be applied.

Vasculum pro thea (a tea cup) contains about f3iij.

Vulnus curare. To dress a wound.

V. o. s. Vitello ovi solutus. Dissolved in the yolk of an egg.

Vom. urg. Vomitione urgente. When the vomiting begins.

—— suppr. Vomitu suppresso. The vomiting being stopped.

INDEX.
